I. Background

Greater Baltimore Medical Center is spearheading a comprehensive assessment of the health needs of individuals living in their primary and secondary service areas. The aim of the assessment is to reinforce Greater Baltimore Medical Center's commitment to the health of residents and to align its health prevention efforts with the community's greatest needs.

The data contained in this report are a compilation of existing demographic and health data also known as "secondary data." The data was gathered and integrated into the report by Holleran, an independent research firm located in Lancaster, Pennsylvania. The specific data sources are listed throughout the report. It should be noted that in some cases, local-level data may be limited or dated. This is an inherent limitation with secondary data. The most recent data is used whenever possible. When available, state and national comparisons are also provided as benchmarks for the regional statistics. National comparisons include United States data and Healthy People 2020 (HP 2020) goals when available.

It is also important to note that social determinants, such as income and education, can significantly impact health status, health behaviors, and health outcomes. Research has shown that lower educational attainment, poverty, and race/ethnicity are risk factors for certain health conditions. For this reason, local demographic information is included in the report for reference.

A Conclusions section is included at the end of the report to highlight strengths and opportunities. State and national comparative data generally determine if an indicator is a strength or opportunity within the community. However, it is still important for readers to interpret the service level data and make appropriate conclusions, independent of the state and national comparisons.

The secondary data profile is one component of the research. Greater Baltimore Medical Center will use the data from the secondary data profile in conjunction with other research components to understand health needs and prioritize community health endeavors.

II. Reading the Results

Demographic and health indicator statistics have been collated to portray the current health status of the Greater Baltimore Medical Center's service area. When available, the most recently published data at the service area level were utilized. For example, if 2011 data were available at the national and state levels, but only 2010 data were available at the service area level, 2010 data were utilized at all levels unless otherwise indicated. If service area level data was not available, county level data for Baltimore County were utilized.

For all demographic and health indicator statistics, data from the following towns or zip codes were incorporated unless otherwise noted. Due to the availability of this data, some of the health indicator statistics represent counts or crude rates only. Crude rates are generally defined as the total number of cases or deaths divided by the total population at risk. Crude rate is generally presented as per populations of 1,000, 10,000 or 100,000 (which will be noted on each table). It is based on raw data and does not account for characteristics such as age, race, and gender. The total population used for most health indicator calculations was the 2010 Census Summary File 1.

Greater Baltimore Medical Center (GBMC) Service Area	
Towns	ZIP Code
Cockeysville	21030
Lutherville, Timonium	21093
Pikesville, Towson	21204
Pikesville	21208
Towson	21286
Owings Mills	21117
Dundalk	21222
Parkville	21234
Nottingham	21236

Definitions

Age-Adjusted Rate - Assumes equal age distributions between populations to account for the effect of age on disease and death rates.

Crude Rate - Generally defined as the total number of cases or deaths divided by the total population at risk. Crude rate is generally presented as per populations of 1,000, 10,000 or 100,000. It is based on raw data and does not account for characteristics such as age, race, and gender.

Family - Defined as more than one person living together, either as relations or as a married couple.

Frequency - Often denoted by the symbol “n,” frequency is the number of occurrences of an event.

Household - Defined as one or more people sharing a residence. Examples include college students sharing an apartment or a single male living alone.

Incidence Rate - Indicates the number of new disease cases in a specified amount of time. Time is determined by the number of years candidates for the disease are observed before they are diagnosed.

Infant Mortality Rate - Defined as the number of infant deaths per 1,000 live births per year. Infant is defined as being less than one year of age.

Low Birth Weight - Indicates a birth weight less than 5 pounds 3 ounces (2,500 grams).

Neonatal Mortality Rate - Defined as the number of infant deaths in the first 27 days after birth per 1,000 live births per year.

Post-Neonatal Mortality Rate - Defined as the number of infant deaths occurring from 28 days to 12 months per 1,000 live births per year.

Poverty Guidelines - A version of the federal poverty measure issued each year in the *Federal Register* by the Department of Health & Human Services. The guidelines are a simplification of the poverty thresholds used for administrative purposes (i.e. determining eligibility for certain federal programs).

Very Low Birth Weight - Indicates a birth weight less than 3 pounds 5 ounces (1,500 grams).

III. Demographic Statistics

A. Population Statistics

Table A1. Overall Population (2010; 2010 - 2014)

	U.S.	Maryland	GBMC Service Area
Population (2010-2014)	314,107,084	5,887,776	291,392
Population Change from 2010	1.7%	2.0%	1.7%
Male population	49.2%	48.4%	46.5%
Female population	50.8%	51.6%	53.5%

VI. Conclusions

The following conclusions are drawn from comparisons of the service area or Baltimore County to Maryland and to the U.S. secondary data. They are categorized as either Areas of Strength, Areas of Opportunity, or Areas of Difference. Areas of Strength highlight factors in which the service area or county has a more favorable outcome than Maryland and the U.S. In contrast, Areas of Opportunity highlight factors in which the service area or county can improve upon in comparison to the state and the nation. Areas in which the service area or county differ notably from the state and national data, but cannot be considered to be strengths or opportunities, are considered Areas of Difference. For example, if the service area has a notably larger male population versus female population, this is neither a strength nor an opportunity, but is an Area of Difference.

AREAS OF STRENGTH

❖ **Household Statistics**

- The service area has a lower percentage of vacant homes (5.4%) when compared to Maryland (10.1%) and the nation (12.5%).
- A lower proportion of residents in the service area spend more than 30% of their income on mortgage (30.8%) when compared to residents across Maryland (34.1%) and the nation (34.2%). A slightly lower percentage of service area residents also spend more than 30% of their income on rent in comparison to the state and the nation.

❖ **Income Statistics**

- Poverty rates for families, female-headed households and individuals are lower in the service area than in Maryland and the nation. The poverty rate for married couple families is better in the service area compared to the nation but slightly worse than the state.
- There are a lower percentage of households in the service area that are below the poverty level and receiving food stamps (36.9%) when compared to Maryland (41.0%) and the nation (51.8%).

❖ **Education Statistics**

- Residents aged 25 years and over in the service area are slightly more likely to have graduated from high school (90.4%) and to have attained a bachelor's degree or higher (39.3%) when compared to Maryland and the nation.
- The percentage of individuals that are currently enrolled in college is higher for the service area (40.4%) when compared to the state (31.7%) and the nation (28.6%).

❖ **Health Insurance Coverage Statistics**

- Residents in the service area are more likely to have health insurance (91.3%) when compared to residents in Maryland (90.1%) and the nation (85.8%).

❖ **Maternal & Child Health Statistics**

- The birth rate per 1,000 live births for mothers aged 19 and younger is lower in the service area (7.3) when compared to Maryland (8.9) and the nation (12.1).

- The percentage of very low birth weight infants (1.4%) in the service area is better when compared to the state (1.7%) and the same as the nation. The percentage also meets the HP 2020 goal of 1.4%.
- The post-neonatal mortality rate in both Baltimore County and the state exceed the HP 2020 goal of 2.0.

❖ **Mental Health Statistics**

- The crude suicide rate per 100,000 in the service area (10.5) is similar to the state (10.1) but both are better than the nation (13.4).

❖ **Communicable Diseases Statistics**

- The service area has a notably lower incidence rate per 100,000 for chlamydia (381.3) when compared to the state (458.9) and the nation (456.1).
- The incidence rate per 100,000 for HIV for adults/adolescents is lower in the service area (16.9) when compared to the state (28.1) and the nation (18.0).

❖ **Cancer Statistics**

- Both the age-adjusted incidence rate and mortality rate per 100,000 for prostate cancer are lower in Baltimore County when compared to the state and the nation.

❖ **Behavioral Risk Factor Surveillance System**

- The service area has a higher percentage of residents that have visited a doctor for a routine checkup within the past year (79.0%) when compared to Maryland (74.7%) and the nation (69.6%).
- There are a lower percentage of smokers (11.6%) in the service area than in the state (14.6%) and the nation (18.1%).

❖ **County Health Rankings**

- Baltimore County ranked in the top half of all 24 counties in Maryland in regard to health factors (11), health behaviors (9), and clinical care (10). There are a few measures in which Baltimore County fairs better than both the state and/or the National Benchmark. Two of the more notable measures that are strengths include:
 - Access to exercise opportunities is higher in Baltimore County (96%) when compared to the state (93%) and the National Benchmark of 91%.
 - The primary care physician density in Baltimore County (970:1) is better than the density in Maryland (1,120:1) and the National Benchmark density of 1,040:1.

AREAS OF OPPORTUNITY

❖ **Household Statistics**

- The service area has a higher proportion of residents 65 years and older living alone (12.5%) when compared to the state (9.2%) and the nation (10.0%).

❖ Mortality Statistics

- The overall crude mortality rate per 100,000 in the service area (1,049.5) is notably higher when compared to the state (767.5) and the nation (823.7).
- Based on crude mortality rates, the top three leading causes of death in the service area are diseases of the heart (261.9), cancer (235.8), and stroke (64.8), which is the same as the top three leading causes of death in Maryland. While the same holds true for the nation for the first two leading causes of death, the third leading cause of death in the nation is chronic lower respiratory disease.
- The crude death rate per 100,000 for diseases of the heart, cancer, stroke, diabetes, influenza and pneumonia, nephritis, nephrotic syndrome, and nephrosis are all worse than the state and the nation. Crude death rates for chronic lower respiratory disease, accidents, and Alzheimer's are better than the nation, but still much worse than the state.

❖ Maternal & Child Health Statistics

- The percentage of women receiving first trimester prenatal care is lower in the service area (61.7%) when compared to Maryland (66.6%). The percent in both the service area and Maryland also fall short of the HP 2020 goal of 77.9%.
- The percentage of low birth weight infants (8.5%) in the service area is similar when compared to the state (8.6%). However, the percent in both the service area and the state are worse than the nation (8.0%) and fall short of the HP 2020 goal of 7.8%.
- The infant (6.3) and neonatal (4.7) mortality rates in Baltimore County are better or the same as the state, but are worse when compared to the HP 2020 goal of 6.0 and 4.1 respectively.

❖ Cancer Statistics

- The overall age-adjusted cancer incidence rate per 100,000 is much higher in Baltimore County (470.5) when compared to Maryland (447.0) and the nation (453.8).
- The overall age-adjusted cancer mortality rate per 100,000 is higher in Baltimore County (178.6) when compared to the state (171.8), the nation (171.2), and the HP 2020 goal of 160.6.
- Both the age-adjusted cancer incidence and mortality rate per 100,000 for breast and lung and bronchus cancer are notably worse in Baltimore County than in the state and the nation.

❖ Crime Statistics

- Both the violent crime rate and the property crime rate are higher in Baltimore County (487.7 and 2,723.7 respectively) when compared to the state and the nation.

❖ Behavioral Risk Factor Surveillance System

- A higher proportion of residents in the service area have been told by their doctor that they have a depressive disorder (20.3%) when compared to Maryland (15.9%) and the nation (18.7%).
- The service area has a higher percentage of residents that have participated in binge drinking in the past month (28.5%) when compared to the state (15.4%) and the nation (16.0%).

- There are a higher percentage of overweight/obese residents in the service area (71.1%) than in the state and the nation (both 64.9%).

❖ **County Health Rankings**

- Baltimore County ranked in the middle or near the bottom half of all 24 counties in Maryland in regard to health outcomes (14), length of life (12), quality of life (17), social and economic factors (12), and physical environment (21). There are many measures that could be improved upon in comparison to Maryland and the National Benchmark in order to increase Baltimore County's rank. Some of the more notable measures needing improvement include:
 - Baltimore County residents reported a higher rate of poor physical and mental health days in the past month (3.2 and 3.9 respectively) when compared to the National Benchmark. This may indicate the burden of chronic diseases and disabilities facing the county.
 - There are a higher percentage of adults reporting excessive drinking in Baltimore County (17%) compared to the National Benchmark of 12%.
 - The percentage of alcohol-impaired driving deaths is higher in Baltimore County (30%) than the National Benchmark (14%).
 - Baltimore County has a higher rate of preventable hospital stays per 1,000 Medicare enrollees (53) when compared to the state (50) and the National Benchmark of 38.

AREAS OF DIFFERENCE

❖ Population Statistics

- Nearly three-quarters of the population in the service area is White (72.8%), which is a larger proportion when compared to Maryland (60.4%), but similar to the nation (76.3%).
- The service area has a much lower percentage of Hispanic or Latino residents (4.5%) when compared to the state and the nation.
- The percentage of individuals who speak a language other than English at home is much lower in the service area (14.4%) when compared to Maryland (22.2%) and the nation (20.9%).

❖ Household Statistics

- The median home value in the service area (\$251,274) is higher when compared to the nation (\$175,700) but is lower compared to Maryland (\$287,500).
- The median amount of dollars spent on housing rental is higher in the service area (\$1,180) when compared to the nation (\$920), but is slightly lower when compared to the state (\$1,218).

❖ Income Statistics

- The median income for households and families is higher in the service area when compared to the nation but is lower, when compared to the Maryland.
