PATIENT GUIDE FOR HIPS

PATIENT NAME

SURGEON NAME

SURGERY DATE

PLEASE BRING THIS GUIDEBOOK THROUGHOUT EVERY STEP OF YOUR SURGICAL JOURNEY INCLUDING:

♦ All appointments with your surgeon
♦ Your hospital Pre-Op class
♦ Your hospital stay
♦ All physical therapy visits before and after surgery
♦ Any placement upon discharge for up to one year

Thank you for choosing The Joint & Spine Center at GBMC. The Center specializes in total joint replacement and spine surgery education and readiness. Every detail, from preoperative teaching and expectations to your postoperative teaching and expectations are considered and reviewed with each patient. The Joint & Spine Center collaborates with other members of the healthcare team to develop individual discharge plans which help to guide patients through the recovery process.

More than 523,100 people undergo total hip replacement surgery each year. Almost all of them have chronic joint pain which they no longer wish to tolerate. The surgery aims to relieve pain, restore independence, and return you to work and other daily activities.

The Joint & Spine Center has developed a comprehensive planned course of treatment. Our goal is to involve patients in their treatment through each step of the program. The first step begins the moment your surgery is planned. It continues with this guidebook, the pre-op class, optimizing your health by doing your pre-op exercises, and if necessary, participating in a smoking-cessation program, weight-loss program, and managing your diabetes. We believe that the patient plays a key role in ensuring a successful recovery. This Patient Guidebook provides the information you need to make your surgery a success.

It is extremely important to know that YOU make the biggest difference in your success following your total joint replacement. Your motivation and participation in your physical therapy program immediately after surgery and throughout your rehab and recovery process has a direct bearing on regaining maximum functional mobility and achieving the highest quality of life you possibly can.

1 Steiner, M.D., M.P.H. et al., 2019
You may call the Joint & Spine Center Monday to Friday from 8 a.m. – 4 p.m. to ask questions or raise concerns about your pending surgery. Please leave a detailed message if we are unable to answer your call. You may also send us an email at jointspinecenter@gbmc.org. If you have medical concerns regarding your joint replacement before or after your surgery, call your surgeon’s office. In a medical emergency, call 911 or go to the nearest emergency room.

The Joint and Spine Center at GBMC and the Ortho Care Coordinator collaborate with Active Life Physical Therapy to offer more support during your surgical planning process. If available, a physical therapist (PT) will reach out to schedule a preoperative home assessment. A home assessment takes place in your residence prior to surgery to best prepare your home for after surgery. The PT will evaluate your physical health, environmental safety, and support systems. Please refer to the next page for more details and how to schedule.

Another option is an outpatient pre-operative physical therapy assessment and evaluation that takes place in an outpatient physical therapy office. This involves a one-on-one session with a physical therapist. During this visit, you will be able to develop strength and improve function of your joint as a component of your optimization for before surgery. Your physical therapist will also make tentative recommendations for your postoperative rehab therapy, which may include exercise modification or specific equipment for your home. The Ortho Care Coordinator can help you facilitate this process, including identifying a convenient physical therapy office.

If you have further questions about your health concerns, please reach out to your Ortho Care Coordinator, the Joint & Spine Center, your surgeon or your primary care team.

The Joint & Spine Center
443-849-6261, M-F 8am-4pm (except holidays)

Benefits of Pre-Operative In-Home Physical Therapy Assessment:

Pre-Operative Measurements:

◆ Home Safety tips:
  • Establish baseline mobility, strength, and range of motion
  • Results communicated with inpatient therapists
◆ Assistive Device Training:
  • Experienced clinicians optimize your living environment
  • Recommend equipment and prepare you for discharge home
  • Prepare for using a walker or cane to navigate your home after surgery
◆ Exercise Review:
  • Will review your Joint Guidebook with you
◆ Discharge Plan Discussions:
  • Ask questions and finalize your potential post-operative plan
The Role of The Joint & Spine Center

The Joint & Spine Program Manager oversees the Joint Replacement Program, aligning with your surgeon and care team. The Joint & Spine Center team will be one of your greatest assets during every step of your surgical experience. Our goal is to help you throughout the entire process to answer all of your questions, or to direct you to someone who can.

GBMC Joint Replacement Program offers:

◆ A joint replacement program tailored to meet your individual needs
◆ Nurses, nurse practitioners, physician assistants, physical therapists, and occupational therapists who specialize in the care of joint patients
◆ Shared decision making with you, your surgeon, your anesthesiology team member, the Ortho Care Coordinator, and case management team member to facilitate preoperative and discharge planning
◆ Comprehensive Patient Guide to follow starting six weeks prior to surgery through the first year after surgery.
◆ Provide you with necessary supplies to use prior to surgery
◆ Joint Replacement Education Class
Role of the Ortho Care Coordinator

The Ortho Care Coordinator will discuss your goals following your surgery. They will discuss with you the ways to best accomplish these goals through:

◆ Providing further resources for smoking cessation, diabetes management, and weight loss
◆ Assisting in connecting you with physical therapy prior to your surgery and discuss preoperative in-home assessments (if applicable)
◆ Reviewing what you will need in your home after your surgery, including identifying your support or “coach”
◆ Discussing options for physical therapy after your surgery, including outpatient physical therapy, in-home physical therapy, or in a facility

Further questions regarding your home setup? Contact your Ortho Care Coordinator to discuss GBMC’s affiliation with ActiveLife PT and their Pre-Op In-Home Assessments.
TOTAL HIP REPLACEMENT SURGERY

We are glad you have chosen The Joint and Spine Center at GBMC to care for your hip. Patients have many questions about total hip replacements. Below is a list of the most frequently asked questions. If you have other concerns, please ask your surgeon or the Joint Care Coordinator. We want you to be completely informed about this procedure.

What is arthritis and why does my hip hurt?

In the hip joint, there is a layer of smooth cartilage on the ball of the upper end of the thighbone (femur) and another layer within your hip socket. This cartilage serves as a cushion and allows for smooth motion of the hip. Arthritis is a wearing away of this cartilage. Eventually, it wears down to bone. Rubbing of bone against bone causes discomfort, swelling, and stiffness.

What is a total hip replacement?

A total hip replacement is an operation that removes the arthritic ball of the upper femur as well as damaged cartilage from the hip socket. The ball is replaced with a metal ball that is fixed solidly inside the femur. The socket is replaced with a plastic or metal liner that is usually fixed inside a metal shell. This creates a smoothly functioning joint that does not hurt.

What are the results of total hip replacement?

Results will vary depending on the quality of the surrounding tissue, the severity of the arthritis at the time of surgery, the patient’s activity level, and the patient’s adherence to the doctor’s orders.
**Using the Patient Guidebook**

Preparation, education, continuity of care, and a pre-planned discharge plan are essential for optimum results in hip surgery. Communication is essential to this process. The Patient Guide is a communication and educational tool. It is designed to educate you so that you know:

- What to expect every step of the way
- What you need to do
- How to care for yourself after hip surgery

Remember, this is just a guide. Your provider may add to or change some of the recommendations. Always rely on their recommendations first and ask questions if you are unsure of any information. Keep this guide as a reference for at least one year after your surgery.

**Important Instructions**

- Read all sections of this Patient Guide.
- Please look for an e-mail from the American Academy of Orthopaedics/American Joint Replacement Registry (AAOS/AJRR), you MUST Complete these online surveys before surgery:
  - These surveys will tell your physician how you were feeling before your orthopaedic surgery. Your answers will help you and your physician better understand how you are doing. This information will also help improve care for patients undergoing similar orthopaedic procedures. Your answers to the survey questions are protected and secure. The AJRR system will only share your information with your physician’s office. Complete your physician’s surveys via the internet using the American Joint Replacement Registry (AJRR) secure patient portal (website).
- Show this patient guidebook to your physical therapist
Six Weeks Before Surgery

Pre-registration

After your surgery has been scheduled, the hospital admissions department will call you to gather your pre-registration information by phone and ask you about your health history. You will need to have the following information ready when you are contacted:

◆ Patient’s full legal name and address, including county
◆ Home phone number, cellular phone number, and e-mail address
◆ Religion
◆ Marital status
◆ Social Security Number
◆ Insurance holder’s full name, home address and phone number, and work address and phone number
◆ Name of insurance company, mailing address, policy number, and group number
◆ Patient’s employer, address, phone number, and occupation
◆ Name, address, and phone number of someone to notify in case of emergency – this can be the same as the nearest relative
◆ Prescription card

Obtain Medical and Anesthesia Clearance

You will need to see your primary care provider for a preoperative medical evaluation in addition to your surgical appointments. When you were scheduled for surgery, you should have received a medical clearance letter from your surgeon telling when you should schedule this and any applicable specialist appointments.

Put your Healthcare Decisions in Writing

The law requires that every person admitted to a medical facility has the opportunity to complete an advance directive concerning medical care. More information is available in the appendix. If you already have an advance directive, please bring a copy with you to the hospital on the day of your surgery.
Six Weeks Before Surgery (continued)

**Consult with Your Primary Care Team**
Discuss with your physician or primary care team your current daily medications, pre-op diagnostic tests, and pre-op lab work in preparation for surgery. You MUST consult with your cardiologist, primary care team, or ordering provider for discontinue date for anticoagulants such as Eliquis, Coumadin, Pradaxa, Plavix, Xarelto, Ticlid, Lovenox injections, or other blood thinners.

**Coach/Support Person(s)**
Designate who will be your coach/support person(s).

**Participate in a Weight-Loss Program**
If you have a BMI of greater than 35, you should talk to your doctor about ways to lose weight. This will help you in recovery. Your Ortho Care Coordinator can provide you with pamphlets about resources available to help you.

**Manage Your Diabetes**
If you are diabetic with an A1c >8, it is important to lower your levels. Managing your diabetes is a major factor in your surgeon’s decision to operate. Your aim is to bring the A1c levels below 7. Please seek the advice of your endocrinologist or your primary care physician.

**Perform Daily Oral Care**
There is an increased risk for pneumonia and other associated infections if oral care is not adequate. Brushing your teeth 3-4 times a day—after you wake up in the morning, after a meal, and before bedtime—is highly encouraged before your surgery and during your post-op period.

**Start Pre-Operative Exercises**
Many patients with arthritis favor their joints, causing them to become weaker, which interferes with recovery. It is imperative that you participate in the pre-operative exercise program. Exercising before surgery can help you build your strength and endurance as well as prepare you for rehabilitation after surgery. Exercise videos can be viewed from the Joint & Spine Center website.

**Start Using Incentive Spirometer (IS) and/or Deep Breathing Exercises**
Start practicing your deep breathing by using your IS. The IS is a great tool used here at the hospital and at home to help prevent chances of pneumonia. Please see pages 33-34 for directions for usage.
Six Weeks Before Surgery (continued)

Register for Pre-Operative Education Class

A class is held weekly for patients scheduled for joint surgery. The Joint & Spine Center will schedule this class for you no later than two weeks prior to your surgery. It is strongly suggested that your designated family member or support person attended this class. Register as soon as possible. Call the Joint & Spine Center or register on our website: https://www.gbmc.org/jointandspine

The outline of the class is as follows:

- Pre-op time sensitive tasks to complete before surgery
- GBMC Hospital specific updates
- Brief review of joint disease and prosthetic
- Enhanced Recovery After Surgery at GBMC
- Planning for surgery and what to expect
- Preventing infections and complications
- The importance of pre-op exercises
- Role of your "coach/support person(s)"
- General overview of your current medication and time lines to stop or continue before surgery
- Day of surgery
- After surgery in the hospital
- Learn about assistive devices and joint protection
- Discharge planning: Case Management, DVT prevention, physical therapy expectation, prescription medications
- The discharge process from the hospital
- Questions and answers

Become Smoke-Free

If you are a smoker, you must stop using tobacco products (including e-cigarettes and vaping) two weeks before surgery. The tar and nicotine in the tobacco products have serious adverse effects on your blood vessels and thus impair the healing of wounds and bone grafts. It is also thought that smokers experience more pain than non-smokers do. Your Ortho Care Coordinator can provide you with pamphlets about resources available to help you.
PRE-OPERATIVE MEDICATION GUIDELINES

10 Days Before Surgery
Current Medications for Pain Management

You can continue your pain medications until the day of surgery. You may also take Tylenol (acetaminophen), Oxycodone, Dilaudid, Neurontin, Flexeril, and Skelaxin. Celebrex is the only NSAID (nonsteroidal anti-inflammatory drugs) that is okay to take during this period.

◆ Stop taking aspirin or aspirin-containing products, including Excedrin®. Aspirin may cause increased bleeding during and after surgery.

◆ Stop taking vitamin E and glucosamine; they may increase bleeding.

◆ Stop taking all herbal products/alternative medications.

◆ If you are on blood thinning medications, you will need special instructions for stopping this medication. Patients taking medications prescribed by a rheumatologist need to speak with that physician. He or she will determine if you need to stop taking these medications prior to surgery.

◆ Any patient who has cardiac stents and/or takes aspirin, Plavix, or any anti-platelet drugs must speak with their cardiologist or primary care team before stopping these medications.

7 Days Before Surgery

◆ Stop taking ALL NSAIDS (nonsteroidal anti-inflammatory drugs):
  - Advil/Motrin (Ibuprofen)
  - Aleve (Naproxen)
  - Toradol (Ketorolac)
  - Nabumetone
  - Mobic (Meloxicam)
  - Robaxin
  - Diclofenac

◆ Stop taking diet and weight-loss medications.

◆ Stop taking CBD oil (cannabidiol).

36 Hours Before Surgery

◆ Stop Viagra, Levitra, and Cialis.

◆ Stop topical medications.
24 Hours before Surgery

◆ You will be instructed by your physician or primary care team on which of your daily medications to take or omit the morning of surgery.

◆ If you have been instructed to take any of your medications pre-operatively, please take with a small sip of water. Speak with your primary care provider if you have any questions about your medications.

◆ Asthma inhalers should be used the morning of surgery and brought with you to the hospital.

◆ You MUST consult with your cardiologist or primary care team regarding all your heart medications for pre-op guidance.
  
  • **Stop** ACE inhibitors such as Lisinopril, Enalapril, and Benazepril.
  
  • **Stop** angiotensin receptor blockers such as Irbesartan, Losartan, Olmesarten, Candesartan, and Valsartan.
  
  • DO NOT stop taking your beta-blockers or calcium-blocker medications to treat your abnormal heart rhythms such as metoprolol, propranolol, verapamil, nifedipine, etc.

◆ Diabetic patients:
  
  • Consult with your endocrinologist regarding your insulin and oral medications.
  
  • **Stop the following medications 24 hours:** Glucophage, Metformin, Riomet, Glumetza, Glucophage XR, Fortamet, Avandamet, Actos-plus, and Glucovance.
  
  • If any of these medications are taken within 24 hours of your surgery, your surgery will be canceled.
The Day Before Surgery

General Instructions

◆ If you become ill prior to your surgery date, contact your surgeon to decide if your surgery should be canceled or postponed.
◆ If you have a toothache or notice an open area on the skin, contact your surgeon.
◆ Do not shave your legs the day before surgery.

Eating and Drinking Before Surgery

◆ No heavy meals past 8 p.m. the night before surgery. You can snack until midnight.
◆ No food after midnight.
◆ STOP drinking fluids six hours before surgery if you have:
  • Diabetes
  • Gastroesophageal reflux disease (GERD)
  • BMI >39
  • Gastroparesis (slow moving gut)
◆ Mints, hard candy, and gum are not allowed after midnight.
Prepare Your Home for Your Return From the Hospital

Having your house ready for your return is essential to your safe recovery. Be sure to do the following:

◆ Clear your home of clutter and clear walkways inside your house.
◆ Clean, do the laundry, and put it away.
◆ Put clean linens on the bed.
◆ Prepare meals and freeze them in single-serving containers.
◆ Pick up throw rugs and tack down loose carpeting.
◆ Remove electrical cords and other obstructions from walk ways.
◆ Install nightlights in bathrooms, bedrooms, and hallways.
◆ Designate who your coach/support person(s) will be.
◆ Arrange to have someone collect your mail and take care of pets or loved ones, if necessary.
◆ Cut the grass, tend to the garden, clear walkways into house of debris or snow, salt snowy or icy sidewalks or pathways, and finish any other yard work.
◆ Make sure your assistive equipment is easily accessible, clean and in safe working order.
What to Bring to the Hospital:

◆ Patient Guide
◆ A copy of your advance directive and living will
◆ Insurance card and co-pay (if applicable)
◆ Personal hygiene items (deodorant, feminine products, incontinent pads, etc.)
◆ Loose-fitting shorts, tops, well-fitted tennis shoes or flat shoes that have a rubber sole and supportive sides (including the back of heel), and items such as your CPAP machine or electric razor.
◆ For safety reasons, do not bring electrical items, except items mentioned above (cellphone and charger are permitted)
◆ List of all current medications
◆ Prescription card (original or a copy)
◆ Glasses and hearing aids

◆ Please bring your small overnight bag with you the day of surgery.

◆ Please be sure to label all personal belongings with your name before bringing them to the hospital.
Pre-Operative Exercises, Goals and Activity Guidelines

Exercising Before and After Surgery

It is important to be as fit as possible before undergoing a total hip replacement. This will make your recovery much faster. Ten exercises are shown here that you should start doing now and continue until your surgery. You should be able to do them in 15-20 minutes. It is recommended that you do all of them twice a day. Consider this a minimum amount of exercise before surgery. Exercise videos can be viewed from the Joint & Spine Center website.

Remember that you need to strengthen your entire body, not just your leg. It is very important that you strengthen your arms by doing chair push-ups (Exercise 8) because you will be relying on your arms to help you get in and out of bed, in and out of a chair, walk, and to do your exercises postoperatively.

Stop doing any exercise that is too painful.

Pre-Op Hip Exercises

(See the following pages for descriptions)

1. Ankle pumps 20 reps. 2 times/day
2. Quad sets (knee push-downs) 20 reps. 2 times/day
3. Gluteal sets (bottom squeezes) 20 reps. 2 times/day
4. Abduction and adduction (slide heels out and in) 20 reps. 2 times/day
5. Heel slides (slide heel up and down) 20 reps. 2 times/day
6. Short arc quads 20 reps. 2 times/day
7. Long arc quads 20 reps. 2 times/day
8. Armchair push-ups 20 reps. 2 times/day
9. Mini squats 20 reps. 1 times/day
10. Seated hamstring stretch 5 reps. 2 times/day
Range-of-Motion and Strengthening Exercises

(1) Ankle pumps

Move ankle up and down. Repeat 20 times.

(2) Quad sets (knee push-downs)

Lie on back, press knee into mat, tightening muscles on front of thigh. Hold for count of five. Do NOT hold breath. Repeat 20 times.
Range-of-Motion and Strengthening Exercises

(3) Gluteal sets (bottom squeezes)

Squeeze bottom together. Hold for count of five. Do NOT hold breath. Repeat 20 times.

(4) Hip abduction and adduction (slide heels out and in)

Lie on back, slide legs out to side. Keep toes pointed up and knees straight. Bring legs back to starting point. Repeat 20 times.
(5) Heel slides (slide heel up and down)

Lie on couch or bed. Slide heel toward your bottom. Repeat 20 times.

(6) Short arc quads

Lie on back, place towel roll under thigh. Lift foot, straightening knee. Hold for count of five. Do not raise thigh off roll. Repeat 20 times.
(7) Long arc quads

Sit with back against chair. Straighten knee. Hold for count of five. Repeat 20 times.

(8) Armchair push-ups

This exercise will help strengthen your arms for walking with crutches or a walker. Sit in an armchair. Place hands on armrests. Straighten arms, raising bottom up off chair seat if possible. Feet should be flat on floor. Repeat 20 times.
(10) Seated hamstring stretch

Sit on couch or bed with leg extended. Lean forward and pull ankle up. Stretch until pull is felt. Hold for 20-30 seconds. Keep back straight. Relax. Repeat five times.
Day of Surgery — What to Expect

In the pre-op area, you will meet your pre-op registered nurse and nurse support tech (NST). You will be prepared for surgery. This includes gathering your medical and surgical history, a list of your home medications, performing a physical assessment, collecting blood work to be sent to the lab, taking your vital signs, a pre-operative skin cleanser, decolonizing the inside of your nose, and starting an IV. Your surgeon will come see you to discuss your surgery. Your operating room nurse, as well as a member from the anesthesia team will come to meet you, discuss your options for anesthesia based on your medical or surgical history, and then escort you to the operating room. Following surgery, you will be taken to a recovery area where you will remain for about two hours. You will then be taken to Unit 58 where the team will care for you. Family and friends will be able to see you at this time.

Once you arrive to Unit 58, you will be greeted by your nurse and nurse support tech (NST) or certified nursing assistant (CNA) will get you settled and familiarized to your room and unit. You will be given ice packs for your hip(s), the staff will update your communication board, an iPad can be assigned to you upon request, and you can ask for something to drink or eat. Generally, there is good pain control after surgery. Please ask your nurse if you need pain relievers.

Patients are expected to walk the day of surgery. Your coach/support person(s) are scheduled to be available during these PT or OT sessions. Depending upon the time when you arrive to Unit 58, a PT or OT will visit you in your room. If there is not a PT or OT to get you out of bed, your RN, NST, or CNA will help you to get out of bed and walking. It is important to do ankle pumps on the first day. This will help prevent blood clots from forming in your legs. You should be using your incentive spirometer and doing deep breathing exercises (see pages 33-34).

Day 1 After Surgery — Preparing for discharge

On Day 1 after surgery, you will be given a wash basin to freshen up, you'll be helped out of bed, and seated in a recliner in your room. Your surgeon/advanced practitioner will visit you in the morning. PT and/or OT will continue to assess your progress and get you walking with a rolling walker (or crutches if appropriate). Your coach/support person(s) are scheduled to be available during these PT or OT sessions. Your therapy goals will be tailored especially for you. Your therapy times will be posted on your communication board in your room or you can view your schedule in your MyChart Bedside app on the iPad.

The occupational therapist will assess your ability to perform self-care activities and educate you and your coach/support person(s) on any needed equipment to make getting dressed easier. If you have met the goals of therapy, have your walker and/or cane, your prescriptions, your post-op PT arranged, your pain is managed well, your surgeon/advance practitioner approves recommendations and writes your discharge instructions, the nursing team will teach and provide the discharge instructions for home.
Going Directly Home

Most patients are discharged home the next day after surgery. You will receive written discharge instructions concerning medications, equipment, therapy needs, activity, etc. Take this Patient Guidebook with you. It is imperative that you continue your exercises every day, three times a day, on your own. It is expected for you to begin working with a PT within 24-48 hours of your discharge day. Home therapy will likely be arranged by the Care Manager, but some patients go directly to outpatient physical therapy; if you and your Ortho Care Coordinator has set-up the appointments. OT is not typically needed after discharge.

If You Are Going to a Skilled Nursing Facility (SNF)

The decision to go home or to a SNF, also known as "rehab", will be made based on your PT, OT, and medical recommendations. The SNF location will be determined collectively by availability of a bed, you the patient, your care manager, your insurance company, and your surgeon. Every attempt will be made to have this decision finalized in advance, but it may be delayed until the day of discharge.

Your transfer papers will be completed by the nursing staff. Upon acceptance to a SNF, your transfer papers will be completed by the nursing staff. Transportation to the facility will be arranged by the care management team. Your primary care provider (PCP) or a clinician from the SNF will be caring for you in consultation with your surgeon. The average stay is 7-10 days, dependent upon your progress. Upon discharge home, the SNF staff will give you further instructions. TAKE THIS PATIENT GUIDEBOOK WITH YOU.

Please remember that additional rehab stays must be approved by your insurance company. A patient’s stay in a SNF must be done in accordance with the guidelines established by Medicare. Although you may desire to go to a SNF when you are discharged, your progress will be monitored by your insurance company while you are in the hospital. Upon evaluation of your progress, you will either meet the criteria for a SNF stay or your insurance company will recommend that you return home with other care arrangements. Therefore, it is important for you to make alternative plans pre-operatively for care at home. In the event an additional rehab stay is not approved by your insurance company, you can always go to rehab and pay privately.

Please keep in mind that most patients do not meet the criteria for admission to a SNF. Remember that insurance companies do not become involved in "social issues," such as lack of caregiver, animals, etc. These issues need to be addressed prior to admission for surgery. For any issues concerning this, please reach out to your Ortho Care Coordinator pre-operatively.
Caring for Yourself at Home

There is a variety of important information you need to know as you head home:

Controlling Discomfort:

◆ Take your pain medicine at least 30 minutes before PT.
◆ Change your position every 45 minutes throughout the day.
◆ Use ice for pain control. Applying ice to your affected joint will decrease discomfort, but do not use it for more than 20 minutes at a time each hour.
◆ It is recommended that you ice before and after your exercise program.

Weaning Off Pain Medication:

◆ Avoid taking acetaminophen (Tylenol®) that is combined with a prescription pain medication (eg. Percocet®), you may unknowingly exceed the recommended daily dose of acetaminophen.
◆ Gradually wean yourself from prescription medication to Tylenol®. You may take two extra-strength Tylenol® in place of your prescription medication up to four times per day.

Body Changes:

◆ Appetite:
  • Your appetite may be poor.
  • Drink plenty of fluids to keep from getting dehydrated.
◆ Sleeping
  • You may have difficulty sleeping (this is normal).
  • Try not to sleep too much or nap during the day.
◆ Energy
  • Do not be surprised if your energy levels drop. This is normal for the first month after surgery.
◆ Constipation:
  • Pain medication can promote constipation.
  • Use a stool softener or laxative if necessary. Some over the counter examples are:
    o Senokot  o MiraLAX
    o Colace  o Magnesium Citrate
Constipation (continued)

- Avoid using fiber laxatives which will make the constipation worse. Examples of those are as follows:
  - Metamucil
  - Benefiber
- If an over the counter stool softener/laxative does not work, call your primary care

Chance of Dislocation:

- Signs/Symptoms:
  - Severe pain
  - Rotation or shortening of leg
  - Inability to walk or move leg
- Prevention:
  - You will be given a copy of your hip precautions in the hospital. The approach your surgeon used to replace your hip determines your specific precautions. You will need to follow these precautions until your surgeon tells you otherwise.

Caring for Your Incision

- You must follow your surgeon’s recommendation and discharge instruction regarding your specific surgical dressing, some patients are instructed to not shower until a certain date.
  - IF you have a Mepilex Border Ag dressing, your surgeon may want you to remove it on post-op day seven.
  - IF you have an Aquacel Ag dressing, follow your surgeons orders; your surgeon may want you to keep it in place until your post-op visit.
- Keep your incision dry.
- Keep your incision covered with a light dry dressing until your staples are removed (usually seven days). You will likely have Mepilex dressing which protects your incision.
- Notify your surgeon if there is increased drainage, redness, pain, odor, or heat around the incision.
- Take your temperature if you feel warm or sick. Call your surgeon if it exceeds 100.5°F.
Your Dressing Should Be Removed:
The waterproof dressing remains in place for seven total days with planned removal as directed by your surgeon. Thereafter, no further dressings are required, although a dry sterile gauze can be placed over the surgical site for comfort if needed.

Note: Unless you see wound drainage is present at the edges of the wound pad. See “time to Change” image to right.

Step 1: Preparing to remove your Mepilex Border Post-op Ag Dressing:
- Wash hands

Step 2: Removing your soiled Mepilex Border Post-op AG dressing:
- Remove the Mepilex Border Pos-op Ag dressing by gently lifting a corner and peeling away from your wound
- Wash hands

Step 3: No further dressings are required, although a dry sterile gauze can be placed over the surgical site for comfort if needed.

***If the border of the dressing has lifted before the 7-days, and/or you suspect water has entered the inside of your dressing, notify your surgeon, you may need to remove the Mepilex.

Notify your surgeon if the surgical incision and/or the surrounding skin looks red, swollen, warm/hot to touch, there is yellowish/tan discharge from the incision, increased incisional pain, or you have a fever.

Time to change. The dressing is saturated when the strikethrough has reached three of the edges.

If only small amount of visible drainage is showing - it's OK to leave dressing in place.

WHEN TO CALL THE HEALTHCARE PROVIDER (doctor, nurse, therapist):
- Any change in the wound that is a concern to you
- If the drainage from the wound increases
- If you have a sudden increase in pain, or new pain in your wound
- If the area around the wound gets red, swollen or painful to touch
- If the wound color changes from pink or red to a tan, brown or black color
- If you get a fever, or if the wound odor gets worse
- If you have questions

NOTE: The recommendation and information in this material should not be considered a substitute for medical advice or diagnosis. See package insert for full instructions and precautions. Please contact your healthcare provider with any questions regarding the care or condition of your wound.
Signs of Infection

- Increased swelling, warmth, and redness at incision site
- Change in color or amount of drainage, odor
- Increased pain in hip
- Fever greater than 100.5°F

Prevention of Infection

- Take proper care of your incision as explained.
- Take prophylactic antibiotics when having dental work or other potentially contaminating procedures. This needs to be done for at least two years to the rest of your life after your surgery depending on your doctor’s recommendation.
- Notify your physician and dentist that you have a total joint replacement.

Prevention of Blood Clots

What are blood clots?
Surgery may cause the flow of blood to your legs to slow and coagulate in the veins of your legs, creating a blood clot. If a clot occurs, you may need to be admitted to the hospital to receive intravenous blood thinners. Prompt treatment usually prevents the more serious complication of pulmonary embolus. Moving around, especially walking, will reduce the chance of a blood clot.

Stockings
Your surgeon may decide to order special white stockings if you have preexisting swelling in your legs or vascular issues. These stockings are used to help compress the veins in your legs, which keeps swelling down and reduces the chance for blood clots.

- If swelling in the operative leg is bothersome, elevate the leg for short periods throughout the day. It is best to lie down and raise the leg above heart level.
- Wear the stockings continuously, removing for one hour a day.
- Notify your physician if you notice increased pain or swelling in either leg.
- Ask your surgeon when you can discontinue wearing the stockings. Usually, this will be done three weeks after surgery.
Signs and Symptoms of Blood Clots in Legs

◆ Pain, tenderness in calf
◆ Swelling in thigh, calf, or ankle that does not decrease with elevation
◆ These signs do not definitely point to a blood clot, but they are early warnings. Don’t be alarmed if they are present but notify your surgeon. The surgeon will arrange for you to visit a radiologist, who will use ultrasound to identify a possible blood clot.

Prevention of Blood Clots

◆ Foot and ankle pumps
◆ Walking, using leg muscles
◆ Staying well-hydrated

Pulmonary Embolus (PE)

An unrecognized blood clot can dislodge from the vein and travel to the lungs. This is an emergency. **CALL 911 immediately** if suspected.

Signs of a PE

◆ Shortness of breath
◆ Sudden chest pain
◆ Difficult and/or rapid breathing
◆ Sweating
◆ Confusion
How to Use Your Incentive Spirometer
Before Surgery

To better prepare you for surgery, we are supplying you with an incentive spirometer (IS) to begin using before your procedure. Your goal is to use this at least 30 times a day before your surgery. This information will teach you how to use the incentive spirometer.

About your Incentive Spirometer

An incentive spirometer (IS) is a device that will expand your lungs by helping you to breathe more deeply and fully. The parts of your incentive spirometer are labeled Figure 1.

![Figure 1. Incentive Spirometer](image)

Use the Incentive Spirometer (IS) before your surgery and do your deep breathing and coughing exercises. This will keep your lungs active throughout your recovery and prevent complications such as pneumonia.
Setting up your incentive spirometer

The first time you use your incentive spirometer (IS), you will need to take the flexible tubing with the mouthpiece out of the bag. Stretch out the tubing and connect it to the outlet on the right side of the base (see Figure 1). The mouthpiece will be attached to the other end of the tubing.

Using your incentive spirometer

When you are using your incentive spirometer (IS), make sure to breathe through your mouth. If you breathe through your nose the incentive spirometer will not work properly. You can plug your nose if you have trouble.

The goal is to use this incentive spirometer at least 30 times throughout the day. Breathing-in several times consecutively may leave you feeling dizzy. Stop and rest if this occurs and try again later.

To use your incentive spirometer (IS), follow the steps below. Sit upright in a chair or in bed. Hold the incentive spirometer at eye level.

1. Slowly breathe out (exhale) completely.
2. Put the mouthpiece in your mouth and close your lips tightly around it. Breathe in (inhale) slowly through your mouth as deeply as you can. As you take the breath, you will see the piston rise inside the large column. While the piston rises, the indicator on the right should move upwards. It should stay in between the 2 arrows (see Figure 1).
3. Try to get the piston as high as you can, while keeping the indicator between the arrows.
   o If the indicator does not stay between the arrows, you are breathing either too fast or too slow.
4. When you get it as high as you can, hold your breath for 5-10 seconds, or as long as possible.
   While you’re holding your breath, the piston will slowly fall to the base of the spirometer.
5. Once the piston reaches the bottom of the spirometer, breathe out slowly through your mouth.
   Rest for a few seconds.
6. Repeat twice. Try to get the piston to the same level with each breath.
7. After each set of breaths, try to cough. Coughing will help loosen or clear any mucus in your lungs.
8. Put the marker at the level the piston reached on your incentive spirometer (IS). This will be your goal next time.

Use your incentive spirometer every few hours, the goal is at least 30 times spread-out through the day. No more than 8-10 times an hour.

Deep Breathing Exercises and/or Incentive Spirometry

1. Sit upright.
2. Take a few slow breaths, then take a slow, deep breath in through your nose.
3. Hold your breath for 2-5 seconds.
4. Gently and Slowly breathe out through your mouth making an “O” shape.
5. Repeat 10-15 times

If you have any questions or concerns, contact us at The Joint and Spine Center 443-849-6261
Weeks 1-2

Most joint patients go directly home, but you may go to a rehabilitation center for 7-10 days if approved by your insurance as a medical necessity. During weeks one and two of your recovery, your two-week goals are to:

◆ Continue with walker or two crutches unless otherwise instructed.
◆ Walk at least 300 feet with support.
◆ Climb and descend a flight of stairs (12-14 steps) with a rail once a day.
◆ Actively bend your hip at least 60°.
◆ Straighten your hip completely.
◆ Independently dressing yourself, sponge bathe or shower (please follow your surgeon’s discharge instruction No soaking or submersion of your surgical site in water until cleared by your surgeon.
◆ Gradually resume homemaking tasks.
◆ Do 20 minutes of home exercises twice a day, with or without your physical therapist, from the program given to you.

Weeks 3-4

During this time, you will continue recovering more independence. Even if you are receiving outpatient therapy, you will need to be very faithful to your home exercise program to be able to achieve the best outcome. Your goals for this period are to:

◆ Wean from full support to a cane or single crutch as instructed.
◆ Walk at least 1/4 mile.
◆ Climb and descend a flight of stairs (12-14 steps) more than once daily.
◆ Bend your hip to 90° unless otherwise instructed.
◆ Independently shower and dress.
◆ Resume homemaking tasks.
◆ Do 20 minutes of home exercises twice a day with or without the therapist.
◆ Begin driving if your left hip had surgery. You will need permission from your surgeon.
Weeks 4-6

You will see much more recovery as you head toward full independence. Your home exercise program will be even more important as you receive less supervised therapy. Your goals for this time period are to:

◆ Walk with a cane or single crutch.
◆ Walk 1/4 to 1/2 mile.
◆ Begin progressing on stairs from one step at a time to regular stair-climbing (foot-over-foot).
◆ Actively bend hip.
◆ Drive a car (regardless of hip operated on).
◆ Continue with home exercise program twice a day.

2. _________(stretch/ )____________________ times/day_______
3. _________(stretch/ )____________________ times/day_______

**Additional Comments:**

PT ___________________________________________
Weeks 6-12

By this time, you should begin resuming all of your normal activities. Your goals are to:

- Walk with no cane or crutch and without a limp.
- Climb and descend stairs in normal fashion (foot-over-foot).
- Walk ½ to 1 mile.
- Improve strength to 80%.
- Resume all activities including dancing, bowling, and golf.

PT ________________________________
Daily Living with Joint Precautions

Getting into bed:
1. Back up to the bed until you feel it on the back of your legs (you need to be midway between the foot and the head of the bed). Slide operated leg out in front of you when sitting down.
2. Reaching back with both hands, sit down on the edge of the bed and then scoot back toward the center of the mattress. (Silk pajama bottoms, satin sheets, or sitting on a plastic bag may make it easier).
3. Move your walker out of the way but keep it within reach.
4. Scoot your hips around so that you are facing the foot of the bed.
5. Lift your leg into the bed while scooting around (if this is your operated leg, you may use a cane, a rolled bed sheet, a belt, or your TheraBand to assist with lifting that leg into bed).
6. Keep scooting and lift your other leg into the bed.
7. Scoot your hips toward the center of the bed.

NOTE: DO NOT CROSS YOUR LEGS to help the operated leg into bed.

Getting out of bed:
1. Scoot your hips to the edge of the bed.
2. Sit up while lowering your non-operated leg to the floor.
3. If necessary, use a leg-lifter to lower your operated leg to the floor.
4. Scoot to the edge of the bed.
5. Use both hands to push off bed. If the bed is too low, place one hand in the center of the walker while pushing up off the bed with the other.
6. Balance yourself before grabbing for the walker.
**Standing up from chair:**

**Do NOT pull up on the walker to stand!**

Sit in a chair with armrests when possible.

1. Scoot to the front edge of the chair.
2. Push up with both hands on the armrests. If sitting in a chair without armrest, place one hand on the walker while pushing off the side of the chair with the other.
3. Balance yourself before grabbing for the walker.

**Walker ambulation**

1. Your goal is to walk as normally as possible.
2. If your doctor has ordered full weight bearing (FWB) or weight bearing as tolerated (WBAT), you should use a rolling walker. You do not need to stop between steps. You may feel more comfortable taking smaller steps initially but work toward increasing your step length and speed as you recover. You should step one foot past the other to regain a normal walking pattern. Step forward with the operated leg.
3. If your doctor has ordered partial weight bearing (PWB), you need to push down into the walker whenever you take a step with your operative leg.
4. Your goal is to step forward, touch your heel first, then transfer your weight to the toe for push off. This is called heel-toe gait and is the natural way to walk.
Getting into the tub using a bath seat:

1. Place the bath seat in the tub facing the faucets.
2. Back up to the tub until you can feel it on the back of your knees. Be sure the seat is behind you.
3. Reach back with one hand for the bath seat. Keep the other hand in the center of the walker.
4. Slowly lower yourself onto the bath seat, keeping the operated leg out straight.
5. Move the walker out of the way but keep it within reach.
6. Lift your legs over the edge of the tub, using a leg-lifter for the operated leg, if necessary.

NOTE: While using a bath seat, grab bars, long-handled bath brushes and hand-held showers make bathing easier and safer, they are typically not covered by insurance.  
NOTE: ALWAYS use a rubber mat or nonskid adhesive on the bottom of the tub or shower.

NOTE: To keep soap within easy reach, make a soap-on-a-rope by placing a bar of soap in the toe of an old pair of pantyhose and attach it to the bath seat.

NOTE: Place a towel, washcloth, or garbage bag on the seat to make turning hips easier when getting in and out of the tub.

Getting out of the tub using a bath seat:

1. Lift your legs over the outside of the tub.
2. Scoot to the edge of the bath seat.
3. Push up with one hand on the back of the bath seat while holding on to the center of the walker with the other hand.
4. Balance yourself before grabbing the walker.
Sitting down on the toilet:

You will need a raised toilet seat or a three-in-one bedside commode over your toilet for 12 weeks after surgery.

1. Take small steps and turn until your back is to the toilet. Never pivot.
2. Back up to the toilet until you feel it touch the back of your legs.
3. If using a commode with armrests, reach back for both armrests and lower yourself onto the toilet. If using a raised toilet seat without armrests, keep one hand on the walker while reaching back for the toilet seat with the other.
4. Slide your operated leg out in front of you when sitting down.

Getting into a car

1. Push the car seat all the way back; recline it if possible. Return it to the upright position for traveling.
2. Place a plastic trash bag on the seat of the car to help you slide and turn frontward.
3. Back up to the car until you feel it touch the back of your legs.
4. Reach back for the car seat and lower yourself down. Keep your operated leg straight out in front of you and duck your head so that you don’t hit it on the doorframe.
5. Turn frontward, leaning back as you lift the operated leg into the car.
Stair-Climbing

Ascend with non-operated leg first. Descend with operated leg first.

Sequence for going up stairs
1. Step up with non-operated leg first.
2. Step up with operated leg next.
3. Bring cane or crutch up last.

Sequence for going down stairs
1. Bring cane or crutch down to next step first.
2. Bring operated leg down next.
3. Bring non-operated leg down last.

Using a “Reacher” or “Dressing Stick”
A reacher or dressing stick can help you remove your pants from your foot and off the floor.

Putting on pants and underwear
1. Sit down.
2. Put your operated leg in first and then your non-operated leg.
3. Use a reacher or dressing stick to guide the waistband over your foot.
4. Pull your pants up over your knees, within easy reach.
5. Stand with the walker in front of you to pull your pants up the rest of the way.

Taking off pants and underwear
1. Back up to the chair or bed where you will be undressing.
2. Unfasten your pants and let them drop to the floor. Push your underwear down to your knees.
3. Lower yourself down, keeping your operated leg out straight.
4. Take your non-operated leg out first and then the operated leg.
Using a Sock Aid
1. Slide the sock onto the sock aid.
2. Hold the cord and drop the sock aid in front of your foot. It is easier to do this if your knee is bent.
3. Slip your foot into the sock aid.
4. Straighten your knee, point your toe, and pull the sock on. Keep pulling until the sock aid pulls out.

Using a Long-Handled Shoehorn
1. Use your reacher, dressing stick, or long-handled shoehorn to slide your shoe in front of your foot.
2. Place the shoehorn inside the shoe against the back of the heel. Have the curve of the shoehorn match the curve of your shoe.
3. Lean back, if necessary, as you lift your leg and place your toes in your shoe.
4. Step down into your shoe, sliding your heel down the shoehorn.

NOTE: Wear sturdy slip-on shoes, or shoes with Velcro closures or elastic shoelaces. DO NOT wear high-heeled shoes or shoes without backs.
Around the House

Kitchen
- DO NOT get down on your knees to scrub floors. Use a mop and long-handled brushes.
- Plan ahead! Gather all your cooking supplies at one time. Then, sit to prepare your meal.
- Place frequently used cooking supplies and utensils where they can be reached without too much bending or stretching.
- To provide a better working height, use a high stool or put cushions on your chair when preparing meals.

Bathroom
- DO NOT get down on your knees to scrub bathtub.
- Use a mop or other long-handled brushes.

Safety and Avoiding Falls
- Pick up throw rugs and tack down loose carpeting. Cover slippery surfaces with carpets that are firmly anchored to the floor or that have non-skid backs.
- Be aware of all floor hazards such as pets, small objects, or uneven surfaces.
- Provide good lighting throughout your home. Install night lights in the bathrooms, bedrooms, and hallways.
- Keep extension cords and telephone cords out of pathways. DO NOT run wires under rugs; this is a fire hazard.
- DO NOT wear open-toe slippers or shoes without backs. They do not provide adequate support and can lead to slips and falls.
- Sit in chairs with arms. It makes it easier to get up.
- Rise slowly from either a sitting or lying position to avoid becoming light-headed.
- DO NOT lift heavy objects for the first three months and then only with your surgeon’s permission.
- Stop and think. Use common sense when deciding what activities are appropriate.
Do’s and Don’ts for the Rest of Your Life

All joint patients need to have a regular exercise program to maintain their fitness and the health of the muscles around their joints. With both your orthopedic and primary care physicians’ permission, you should be on a regular exercise program three to four times per week lasting 20 to 30 minutes.

Impact activities such as running and singles tennis may put too much load on the joint and are not recommended. High-risk activities such as downhill skiing is likewise discouraged because of the risk of fractures around the prosthesis and damage to the prosthesis itself. Infections are always a potential problem, and you may need antibiotics for prevention.

What to Do in General

◆ Check with your surgeon or dentist regarding the use of antibiotics before you have dental work or other invasive procedures for at least two years after surgery, depending on your doctor’s recommendation.

◆ Although the risk is very low for postoperative infections, it is important to realize that it remains. A prosthetic joint may attract the bacteria from an infection in another part of your body. If you should develop a fever of more than 100.5° or sustain an injury such as a deep cut or puncture wound you should clean it as best you can, put on a sterile dressing or Band-Aid®, and notify your doctor. The closer the injury is to your prosthesis, the greater the concern. Occasionally, antibiotics may be needed. Superficial scratches may be treated with topical antibiotic ointment. Notify your doctor if the area is painful or reddened.

◆ When traveling, stop and change positions hourly to prevent your joint from tightening.

◆ Get a card from the Total Joint Care Coordinator that states you had a joint replacement. Carry the card with you, as you may set off security alarms at airports, malls, etc.

◆ See your surgeon every 2-3 years unless otherwise recommended. (See appendix for follow-up visits).
Exercise To Do’s

Choose low-impact activities such as:
◆ Recommended exercise classes
◆ Exercises outlined in Patient Guide
◆ Regular 1-3-mile walks
◆ Treadmill (for walking)
◆ Stationary bike
◆ Low-impact sports such as golf, bowling, walking, gardening, dancing, etc.

Exercise Don'ts

◆ Do not run or engage in high-impact activities.
◆ Do not participate in high-risk activities such as downhill skiing, etc.
One risk of having surgery is an infection at the surgical site (any cut the surgeon makes in the skin to perform the operation). Surgical site infections can range from minor to severe or even fatal. This sheet tells you more about surgical site infections, what hospitals are doing to prevent them, and how they are treated if they do occur. It also tells you what you can do to prevent these infections.

**What Causes Surgical Site Infections?**
Germs are everywhere. They’re on your skin, in the air, and on things you touch. Many germs are good, but some are harmful. Surgical site infections occur when harmful germs enter your body through the incision in your skin. Some infections are caused by germs that are in the air or on objects, but most are caused by germs found on and in your own body.

**What Are the Risk Factors for Surgical Site Infections?**
Anyone can have a surgical site infection. Your risk is greater if you:

- Are an older adult
- Have a weakened immune system or other serious health problem such as diabetes are malnourished (don't eat enough healthy foods), or very overweight
- Smoke
- Have a wound that is left open instead of closed with sutures

**What Are the Symptoms of a Surgical Site Infection?**
The infection usually begins with increased redness, pain, and swelling around the incision. Later, you may notice a greenish-yellow discharge from the incision. You are also likely to have a fever and may feel very ill. Symptoms can appear any time from hours to weeks after surgery. Implants such as an artificial knee or hip can become infected a year or more after the operation.

**How Are Surgical Site Infections Treated?**

- Most infections are treated with antibiotics. The type of medication you receive will depend on the germ causing the infection
- An infected skin wound may be reopened and cleaned
- If an infection occurs where an implant is placed, the implant may be removed
- If you have an infection deeper in your body, you may need another operation to treat it

**Preventing Surgical Site Infections: What Hospitals Are Doing**

Many hospitals, including GBMC, take these steps to help prevent surgical site infections:

**Handwashing:** Before the operation, your surgeon and all operating room staff scrub their hands and arms with an antiseptic soap.

**Pre-op CHG wash:** The morning of your surgery, your pre-op nurses will have you wash your
skin with a chlorhexidine gluconate (CHG) solution. Using CHG will reduce your risk of getting an infection.

**Pre-op MSSA/MRSA decolonizing nasal cleanser: Nozin® Nasal Sanitizer® is an advanced antiseptic for nasal decolonization of germs that can transfer into the surgical incision site. The morning of your surgery, your nurse will clean the inside of your nose with Nozin®.**

**Clean skin:** The site where your incision is made is carefully cleaned with an antiseptic solution.

**Sterile clothing and drapes:** Members of your surgical team wear medical uniforms (scrub suits), long-sleeved surgical gowns, masks, caps, shoe covers, and sterile gloves. Your body is fully covered with a sterile drape (a large sterile sheet) except for the area of the incision.

**Clean air:** Operating rooms have special air filters and positive pressure airflow to prevent unfiltered air from entering the room.

**Careful use of antibiotics:** Antibiotics are given no more than 60 minutes before the incision is made and are stopped shortly after surgery. This helps kill germs but avoids problems that can occur when antibiotics are taken for longer periods of time.

**Controlled blood sugar levels:** After surgery, blood sugar levels are watched closely to make sure they are within the normal range. High blood sugar delays wound healing.

**Controlled body temperature:** A lower body temperature during or after surgery prevents oxygen from reaching the wound and makes it harder for your body to fight infection. Hospitals may warm IV fluids, increase the temperature in the operating room, and provide warm-air blankets to prevent this.

**Proper hair removal:** Any hair that must be removed is clipped, not shaved with a razor. This prevents tiny nicks and cuts through which germs can enter.

**Wound care:** After surgery, the closed wound is covered with a sterile, water-resistant dressing.

---

**Preventing Surgical Site Infections: What Patients Can Do**

- Ask questions to learn what your hospital is doing to prevent infection.
- An MSSA/MRSA nasal swab test will be done at GBMC's Diagnostic Center (Monday-Friday, 8am-11am).
- You will receive a CHG Pre-op Skin Cleanser Kit with instructions for use. This pre-op CHG skin prep begins three nights before surgery with the fourth wash the morning of surgery before you come to the hospital. Your surgeon may need you to continue to use the CHG wash when you are discharged home. Follow the instructions you are given for the CHG antiseptic.
- If you smoke, stop or cut down. Ask your doctor about ways to quit.
- Take antibiotics only when told to by a healthcare provider. Using antibiotics when they're not needed can create germs that are harder to kill. Finish any prescribed antibiotics, even if you feel better before they are done.
- Be sure healthcare workers clean their hands with soap and water or with an alcohol-based hand cleaner before and after caring for you. Don't be afraid to remind them.
◆ After surgery, you will continue to use the Post-op Nozin® Nasal Sanitizer® every 12 hours until your post-op wound check with your surgeon or until the 12-mL bottle is empty (30 days/twice a day).
◆ When you return home, care for your incision as directed by your doctor or nurse.
◆ Eat a healthy diet.

Call Your Doctor If You Have Any of the Following:

◆ Increased soreness, pain, or tenderness at the surgical site
◆ A red streak, increased redness, or puffiness near the incision
◆ Yellowish or bad-smelling discharge from the incision
◆ Stitches that dissolve before the wound heals
◆ Fever of 101°F or higher
◆ A tired feeling doesn’t go away
How to use the CHG solution skin treatment before your procedure or surgery

Prior to surgery, you should clean your skin with chlorhexidine gluconate (CHG) solution. Using CHG on your skin will reduce your risk of getting an infection. It is very important that you follow these directions every night, starting three nights before your surgery, and on the morning of surgery.

Why do I need to take a shower and then apply the CHG solution?

- Using the CHG on your skin after using soap and shampoo and rinsing is the best way to remove germs from your skin.
- This helps keep you from getting an infection from germs (known as "superbugs") that are difficult to treat.
- Surgeries, drains, some medicines, and being ill make it easier to get an infection.
- CHG works for 24 hours.

How to use the CHG solution skin treatment:

- **Starting three nights** before your procedure, take a shower with your regular soap and rinse.
- Wash hair with regular shampoo and rinse.
- Turn off the shower. Place a large amount of CHG solution on 6 disposable cloths.
- Apply the CHG onto your skin, from your neck down. **Apply the CHG in the order shown on picture below, starting at number 1 and ending at number 6.** Use one cloth for each area of the body.
- Do not allow CHG to come in contact with your face, eyes, nose, mouth, ears, and genitals.
- Allow the CHG to sit on your skin for 2-5 minutes. Rinse with water.
- Pat dry with clean towel.
- Do not use any lotion, oils, ointments, topical medication, or hair removing lotions.
- Wear clean clothes and sleep on clean sheets.
- Do this again every night and in the morning before your procedure. **Place a check mark in the yellow circles below for each use.**

1: Neck, chest, and stomach

2: Both arms (front and back), arm pits, hands, and fingers

3 & 4: Both legs, feet, and toes

5: Back of neck, back, and shoulders

6: Surgical site

3: Three nights before surgery

4: Two nights before surgery

5: One night before surgery

6: Morning of surgery
Exercise Your Rights – Put Your Healthcare Decisions in Writing

It is the policy of GBMC to place patients’ wishes and individual considerations at the forefront of their care and to respect and uphold those wishes.

**What Are Advance Medical Directives?**
Advance directives are a means of communicating to all caregivers the patient’s wishes regarding health care. If a patient has a living will or an appointed a healthcare agent and is no longer able to express his or her wishes, the medical center is committed to honoring the wishes of the patient as they were documented at the time the patient was able to make that determination.

**There are different types of Advance Directives:**

**Living wills** are written instructions that explain your wishes for healthcare if you have a terminal condition or irreversible coma and are unable to communicate.

**Appointment of a Healthcare Agent** (sometimes called a medical power of attorney) is a document that lets you name a person (your agent) to make medical decisions for you if you are unable to do so.

**Healthcare instructions** are your specific choices regarding use of life-sustaining equipment, hydration, nutrition, and use of pain medications.

Once admitted to the hospital, you will be asked if you have an advance directive. If you do, please bring copies of the documents to the hospital with you, so they can become part of your medical record. Advance directives are not required for hospital admission.

**Blood Transfusions**

There will be some blood loss with knee replacement surgery. Most patients will not require a blood transfusion, but, if a transfusion is needed, the GBMC Blood Bank has blood available.
Anesthesia

What is Anesthesia?
It is a painless state brought about by the administration of a variety of medications.

Who will give me anesthesia?
At GBMC, the Operating Room and Post Anesthesia Care Unit (PACU) are staffed by the Anesthesia Care Team. The team is made up of board-certified or board-eligible anesthesiologists and certified nurse anesthetists (CRNA). An anesthesiologist or a CRNA will administer your anesthetic and will be closely monitoring you throughout your procedure and in the recover area (PACU).

What type of anesthesia will I have?
On the morning of surgery, you and your anesthetist will discuss and decide the type of anesthesia selected for your surgery based on your H&P and other factors one or more may be selected:

General anesthesia which involves administering medications and gases to produce a loss of consciousness. Initially, medication is administered intravenously to help control pain, then, once you are unconscious, often a breathing tube (endotracheal tube) is inserted into your windpipe so anesthetic gases can be administered safely.

Spinal block is a form of regional anesthesia involving the injection of a local anesthetic into the fluid surrounding the spinal cord in the lower back – this will numb the legs and block all sensation in the lower half of the body for several hours. You will be sedated and not awake.

Nerve block can help to block the sensation of pain up to 24-72 hours postoperatively. Other means of pain relief may then be necessary.

Will I have side effects?
Your anesthesiologist will discuss the risks and benefits associated with general anesthesia and/or spinal anesthesia, including the side effects. Typical side effects include nausea, thirst, shivering, sore throat, and urinary retention.

Do I need to do anything before I can have anesthesia?
To assure your well-being during anesthesia, you may be required to have lab tests, X-rays, or an electrocardiogram (EKG). Before surgery you will receive directions regarding eating, drinking, and smoking. Follow these directions exactly.
May I choose an anesthesiologist?

All patients are assigned an anesthesiologist. If you have questions about your insurance coverage or medical plan participation by the anesthesiologist, please contact your insurance carrier for guidance or you may contact Physicians Anesthesia Associates P.A. at 410-296-4616.

What will happen before my surgery?

Your anesthesiologist will conduct a preoperative interview to ask questions about:

- Your recent health history (colds, flu, etc.)
- Current health history (GERD, acid reflux, morbid obesity with a BMI of greater than 40, sleep apnea)
- Chronic medical conditions (heart disease, high blood pressure, diabetes)
- Prescriptions and over-the-counter medications
- Allergies
- Previous surgeries
- Past experiences with anesthesia and anesthetic experiences of your biological/blood relatives
- Use of alcohol, tobacco, and illegal substances

Be sure to discuss your concerns and questions with your anesthesiologist. It is helpful to make a list of your medications, allergies, and questions. In the preoperative area, you will have an intravenous (IV) line inserted and preoperative medications may be given. Once in the operating room, monitoring devices such as a blood pressure cuff and EKG electrodes will be attached. At this point you will be ready for anesthesia.

What does my anesthesiologist do during surgery?

Your anesthesiologist is responsible for monitoring and maintaining your vital signs including heart rate and rhythm, blood pressure, breathing, temperature, and fluid and electrolyte balance. The anesthesiologist is also responsible for your comfort and well-being during and immediately after surgery.
Enhanced Recovery After Surgery (ERAS®)

The Joint & Spine Center at GBMC is proud to adopt the Enhanced Recovery After Surgery (ERAS®) program. ERAS® refers to patient-centered, evidence-based, multidisciplinary team developed pathways for our total joint replacement surgeries to reduce your surgical stress response, optimize your physiologic function, and facilitate your recovery. These care pathways form an integrated continuum as you move from preadmission to recovery at home.

Why ERAS®?

Numerous research reports have shown that employing ERAS® as opposed to traditional care has marked effects on recovery. In many surgeries, recovery time can be shortened by 30% or more.

In addition, complication rates after surgery are lessened, and modalities for pain management intra-operatively have decreased the use of opioids after surgery as patients report minimal to no pain. This promotes walking the day of surgery, eating and drinking, and sleep hygiene.
You may be given one of the following medications after surgery to reduce the risk of blood clots. Additional information about each medication can be found in this appendix.

**Aspirin**
This antiplatelet medication is optimal for patients who are active and are at low risk for developing a blood clot, or for patients who are unable to take other anticoagulant (blood-thinning) medications.

**Apixaban (Eliquis)**
Eliquis® prescribed for four to six weeks following surgery. It is a pill that must be taken once a day.

**Warfarin (Coumadin)**
Coumadin® is prescribed for up to six weeks following surgery. It comes in pill form and must be taken once each night at the same time. The amount you take may change depending on how much your blood thins. Therefore, it will be necessary to do blood tests once or twice weekly while on the medication.

**Enoxaparin (Lovenox) or Fondaparinux (Arixtra)**
Your physician will determine the number of doses needed each day of Lovenox® or Arixtra®, as well as the duration of therapy. The prescription comes in pre-filled syringes that will be injected into the fatty tissue around your stomach. You will be provided with injection instructions prior to discharge from the hospital.

**Portable Intermittent Compressions Device (ICD/SCD)**
If you are taking aspirin, your surgeon may suggest a portable SCD device to use when you leave the hospital. This device uses cuffs around the legs that fill with air and squeeze your legs. Using your SCD at home in combination with the aspirin reduces the risk of developing a blood clot after surgery by promoting circulation. Many commercial insurances will cover the cost of this device; however, some companies and noncommercial providers have an out-of-pocket cost component. Check with your provider to see what is covered under your plan. This portable SCD/ICD device can be given to you at the time of discharge from the hospital.
Coumadin®

Coumadin® is an anticoagulant. The purpose of this medication is to prevent harmful clots from forming. The medication works by decreasing the amount of active clotting factors in the bloodstream.

Instructions

Coumadin® remains in the body for a prolonged time. Therefore, it needs to be taken only ONCE daily. You should learn and understand the following instructions about taking Coumadin®:

• Take Coumadin® at the same time every day.
• Take Coumadin® exactly as the physician or pharmacist prescribes.
• NEVER take more or less of Coumadin® unless specifically told to by your physician or the GBMC pharmacist.
• If you forget to take your dose, DO NOT double your dose the next day – take your regularly prescribed dose. Missing only one dose will not cause a clot to form, while taking more than the prescribed dose may cause bleeding.

Determining Dosage

While you are taking Coumadin®, a blood test will be done each day that you are in the hospital to monitor the effectiveness of the medication. This blood test is called the prothrombin time, PT, or INR. When you are discharged from the hospital, the blood test monitoring is decreased to two times a week. Coumadin® therapy will normally continue for three to six weeks based on your individual situation as determined by your physician.

Monitoring Dosage After Discharge

HOME – If you are discharged to home with home health services, the home health nurse will come out twice a week to draw the prothrombin time. These results are called in to the pharmacist who will call you to adjust your dose if necessary.

OUTPATIENT – If you DO NOT utilize home health nursing, then you will have to go to an outpatient medical lab or the GBMC Anticoagulation Clinic to and have the prothrombin time drawn there. You may contact the GBMC Anticoagulation Clinic by calling (443)849-2769. After testing, the pharmacist/physician will call you to adjust your Coumadin® dose if needed.

REHAB – If you are transferred to rehab, the monitoring is usually done two times a week. The physician or pharmacist caring for you at the rehab will adjust the Coumadin® dose as necessary. When you are discharged from rehab, the rehab staff, if necessary, will arrange home health or outpatient blood monitoring.
Signs of Adverse Effects

Because one of the signs of too much Coumadin® is bleeding, you should be aware of the signs and symptoms of bleeding. Call your doctor right away if any of these signs and symptoms are present. Also, call your doctor if you sustain any falls or injuries while taking Coumadin®.

◆ Excessive bleeding from your gums while brushing your teeth
◆ Frequent and severe bruising
◆ Unexplained nosebleed
◆ Dark or bloody urine
◆ Black or tarry stools or blood in your stools
◆ Unusual bleeding

Drugs to Avoid While Taking Coumadin®

Aspirin, aspirin-containing, nonsteroidal medications (ibuprofen, naproxen, ketoprofen, etc.), and herbal products can all INCREASE the effect of Coumadin® and should be avoided unless prescribed by a physician and the dose of Coumadin® adjusted. Inform all of your doctors that you are on Coumadin® and consult your pharmacist before taking any over-the-counter medications.

How Diet Affects Coumadin®

Changes in diet may also affect the way Coumadin® works. It is important to maintain a steady, well-balanced diet. Too many dark green leafy vegetables on consecutive days may alter the prothrombin time. Therefore, maintain the same weekly balance of vegetables.

Alcohol

Alcohol consumption should be avoided while on Coumadin® because it can also increase the prothrombin time.
Eliquis®

Eliquis® is an anticoagulant that is indicated for the prevention of deep vein thrombosis (DVT), which may lead to pulmonary embolism. Eliquis® works by blocking factor Xa, which is critical to the blood-clotting process.

Instructions

Your doctor may prescribe Eliquis®, which is typically prescribed in 2.5-mg tablets taken twice a day (morning and night). The physician or pharmacist will dose the medication based on your individual need. If a dose of Eliquis® is not taken at the scheduled time, the dose should be taken as soon as possible on the same day and twice-daily administration should be resumed. The dose should not be doubled to make up for a missed dose. Do not change your dose or stop taking Eliquis® unless your doctor tells you to.

Signs of Adverse Effects

Because apixaban (Eliquis®) decreases your body’s ability to form clots, you will be at an increased risk for bleeding. It is important to notify your physician or pharmacist if you notice any of the following:

◆ Bleeding or oozing from your surgical wound
◆ An allergic reaction to Eliquis® can cause hives, rash, itching, and possibly trouble breathing. If you experience this reaction, it will usually happen soon after you take a dose of Eliquis®.
◆ Contact your doctor if you fall or injure yourself, especially if you hit your head
◆ Call your doctor or get medical help right away if you have any of the following symptoms:

- Unexpected or severe bleeding or bleeding that lasts a long time such as unusual bleeding from the gums, frequent nose bleeds, or menstrual or vaginal bleeding that is heavier than normal
- Red, pink, or brown urine; tar-like red or black stool
- Coughing up or vomiting blood or vomit that looks like coffee grounds
- Unexpected pain, swelling, or joint pain
- Headaches, or feeling dizzy or weak
- Chest pain or tightness
- Trouble breathing or wheezing
- Swelling of your face or tongue
Do Not Take Eliquis® If:
  ◆ You have artificial heart valves
  ◆ Currently have certain types of abnormal bleeding
  ◆ Have had a serious allergic reaction to Eliquis®

Drugs to Avoid While Taking Eliquis®

Aspirin, aspirin-containing, nonsteroidal medications (ibuprofen, naproxen, ketoprofen etc.), warfarin sodium (Coumadin®, Jantoven®), and any medication that contains heparin, select serotonin reuptake inhibitors (SSRIs) or serotonin norepinephrine reuptake inhibitors (SNRIs).

Inform all of your doctors that you are on Eliquis® and consult your pharmacist before taking any over-the-counter medications or herbal products.
Enoxaparin (Lovenox®) and Fondaparinux (Arixtra®)

How Lovenox® and Arixtra® work

Lovenox® and Arixtra® are anticoagulants. The purpose of these medications is to prevent harmful clots from forming or growing. Each of these medications works by inhibiting active clotting factors in the bloodstream.

Instructions

Your doctor may prescribe either Lovenox® or Arixtra®. Both medications come in prefilled syringes that are ready to use. Lovenox® is usually given twice daily and Arixtra® is given once daily. Prior to discharge from the hospital, you will be given instructions for injecting your medication. Follow these instructions to self-inject the medication into the fatty tissue around your stomach.

• NEVER inject the medication into your muscle.
• Take your medication at the same time every day and exactly as the physician or pharmacist prescribes.
• NEVER take more or less of your medication unless specifically told to by your physician or pharmacist.
• If you forget to take your dose, DO NOT double up on your dose, but take your regularly prescribed dose. Missing only one dose will not cause a clot to form, while taking more than the prescribed dose may cause bleeding.
• Contact your physician or pharmacist if you suspect you have used too much of your medication. Dispose of your syringes into a sharps container and keep out of the reach of children.

Determining Dosage

The physician or pharmacist will dose the medication based on your individual need. Therapy will normally continue for 7 to 42 days, depending on your ability to ambulate and your physician’s discretion.
Signs of Adverse Effects

Because Lovenox® and Arixtra® decrease your body’s ability to form clots, you will be at an increased risk for bleeding. It is important to notify your physician or pharmacist if you notice any of the following:

◆ Bleeding or oozing from your surgical wound
◆ Any other bleeding – bleeding at the site of injection, nosebleeds, dark or bloody urine, black or tarry stools, or if you cough or vomit blood
◆ Spontaneous bruising (a bruise not caused by a blow or an apparent reason)
◆ Pain or swelling in any part of your leg, foot, or hip
◆ Dizziness, numbness, or tingling
◆ Rapid or unusual heartbeat
◆ Chest pain or shortness of breath
◆ Vomiting, nausea, or fever
◆ Confusion

Remember to look at your previous injection sites for: redness, pain, warmth, puffiness, discoloration of the skin, or oozing, which could be signs of infection or a skin reaction. If you notice any of these signs, or anything unusual, contact your physician or pharmacist immediately.

Drugs to Avoid While Taking Lovenox® or Arixtra®

Aspirin, aspirin-containing, nonsteroidal medications (ibuprofen, naproxen, ketoprofen etc.) and herbal products can all INCREASE the effect of Lovenox® and Arixtra®. Therefore, they should be avoided unless prescribed by a physician who is aware of the Lovenox® or Arixtra® therapy.

Inform all of your doctors that you are on Lovenox® or Arixtra® and consult your pharmacist before taking any over-the-counter medications or herbal products.

Alcohol

Alcohol consumption should be avoided while on Lovenox® or Arixtra® because it can increase the risk of bleeding.
Physical Therapy Daily Schedule

Please note: all times are approximate. Your nurse can post your PT and OT times on the communication board in your room, or you can view your schedule in the MyChart Bedside app.

Day of Surgery: Patients are expected to walk the day of surgery. Coaches are encouraged to be available. Depending on when you arrive to Unit 58, a PT will visit you in your room. If there is not a PT to get you out of bed, then your RN, NST, or CNA will help you.

Post-Op Day 1: Patients will be seen individually in their room the morning of post-op Day 1. This will occur between 7:45 a.m. and 11:00 a.m. Coaches are encouraged to be available at 7:45 a.m. If you were not seen on the day of surgery, you may receive a second PT visit during the afternoon. Most patients are discharged on this day.

Post-Op Days 2-3: If you are still here, you will have individual therapy every day you are in the hospital. You may be discharged after your therapy is completed.
Occupational Therapy (OT) Daily Schedule

Individuals scheduled for total hip replacements will see an OT for one session per day.

**Day of Surgery:**
In some cases, patients can be evaluated by OTs on the day of surgery.

**Post-Op Day 1:**
OT evaluation and treatment occurs between 7:45 a.m. and 11:30 a.m. Coaches are encouraged to be available. Most patients are discharged on this day.

**Days 2-3:**
All patients have OT treatment; coaches are encouraged to be available at the scheduled time.

**Discharge:**
If coaches have not already been present for an OT session, they are encouraged to do so today to ensure they are comfortable supervising the patient for safety at home.
Recommended Exercise Classes

Arthritis Foundation Aquatic Program
Program participants are led by certified aquatic fitness professionals through a series of specially designed exercises that, with the aid of the water’s buoyancy and resistance, can help improve joint flexibility and muscular strength. The warm water (86° to 93°) and gentle movements can also help relieve pain and stiffness. The Arthritis Foundation has developed the program; physician’s permission is required.

PACE® (People with Arthritis Can Exercise)
PACE® was also developed by the Arthritis Foundation, but the benefits are not limited to individuals with arthritis. PACE® uses gentle activities to promote increased joint flexibility and range of motion and to help maintain muscle strength. The advanced version helps increase stamina through a brief, light, low-impact aerobics component.

Participants must be ambulatory, and a physician’s permission is required. All programs provided through Major Changes Incorporated are designed to help participants lead a more fulfilling, active, and healthy lifestyle. All participants are encouraged to participate at their own pace. We recommend that all participants consult with their physician before starting any fitness or exercise program. The programs run continuously; you may start at any time. Students are encouraged to mix and match programs in order to promote a balanced fitness regimen.

For more information, visit the Arthritis Foundation website at www.arthritis.org or call 1-800-283-7800.
The Importance of Lifetime Follow-Up Visits

Over the last several years, orthopedic surgeons have discovered that many people are not following up with their surgeons on a regular basis.

You should follow up with your surgeon:
- Every 2-3 years, unless instructed differently by your physician
- Anytime you have mild pain for more than a week
- Anytime you have moderate or severe pain

Reasons for routine follow-up visits with your orthopaedic surgeon:

1. If you have a cemented hip, we need to evaluate the integrity of the cement. With time and stress, cement may crack. This usually happens slowly over time and patients are often unaware of it. Seeing a crack in cement does not necessarily mean you need another surgery, but it does mean we need to follow things more closely. Your hip could become loose, and this might lead to pain. Alternatively, the cracked cement could cause a reaction in the bone called “osteolysis,” which may cause the bone to thin out and result in loosening. In either case, you might not know this for years. Orthopaedists are constantly learning more about how to deal with both problems. The sooner we know about potential issues, the better chance we have of avoiding more serious complications.

2. The second reason for follow-up is that the plastic liner in your hip may wear. Little wear particles combine with white blood cells and may get in the bone and cause osteolysis, similar to what can happen with cement. Replacing a worn liner early and grafting the bone can keep this from worsening.

X-rays taken at your follow-up visits can detect these problems. Your new X-rays can be compared with previous films to make these determinations. This should be done in your doctor’s office. Most patients do so well that they do not think of us often. If you are unsure how long it has been or when your next visit should be scheduled, call your doctor.
SPORTS ACTIVITY PARTICIPATION

Always consult your surgeon before beginning or resuming a new activity.

Activities that pose a low level of risk:

- Golfing
- Swimming laps
- Cycling
- Sailing
- Bowling
- Scuba diving
- Cross-country skiing
- Low-impact aerobics
- Gardening
- Dancing

Activities that pose a moderate level of risk:

- Singles or doubles tennis
- Hiking
- Backpacking
- Speed walking
- Ice skating
- Ballet
- Alpine skiing
- Softball
- Volleyball
- Horseback riding

Activities that are NOT recommended that pose a high level of risk:

- Soccer
- Baseball
- Running/jogging
- Basketball
- Football
- Handball
- Racquetball
- Hockey
- Waterskiing
- Karate
- Wrestling
GBMC Hospital is a Total Knee Replacement & Total Hip Replacement TJC Certified Facility. Participation in The American Joint Replacement Registry (AJRR) is a requirement of this certification and demonstrates GBMC’s dedication to improving orthopaedic care through collecting, analyzing, and benchmarking data on total hip and knee replacements from across the entire United States. AJRR provides a wide range of actionable information and reporting that helps improve patient care, identify potential problems, and support quality improvement initiatives.

This notice is to advise you of GBMC’s participation and that such participation requires the disclosure of patient protected health information (PHI). The American Academy of Orthopaedic Surgeons (AAOS), which operates the AJRR, is obligated to safeguard your PHI and is not permitted to further disclose such PHI without authorization. The type of PHI submitted to AJRR includes the following patient-related data: full name, date of birth, gender, last 4 digits of the social security number, continuing care information, such as: discharge summary, history and physical, consultation, operative report, diagnostic and medical tests, pathology report, laboratory results and radiology reports.

While the data that AJRR provides is important to furthering GBMC’s mission, we also respect our patients’ right to request restrictions on how their medical information is used. If you would Opt-Out of the AJRR, please request an Opt-Out form from The Joint and Spine Center.
Companionship, personal care, meal preparation and nutritional services, medication, mobility/transportation, supportive services, and light housekeeping

Avila Home Care is excited to announce its partnership with LifeBridge Health as well as GBMC HealthCare and Gilchrist. These are two of the leading medical systems in the mid-Atlantic region. By partnering with Avila, these respected healthcare systems will be able to provide a more seamless continuum of care for their patients and allow their patients to receive quality care in the comfort of their own homes.

Avila is a community of caregivers dedicated to providing everything you or your loved one needs to thrive in the home you love. Together, our leadership team has a wealth of experience in senior living and healthcare. We understand families, healthcare, and the elderly, and we're dedicated to providing extraordinary care delivered with unparalleled kindness.

We would love to meet with you at your convenience to answer any questions. We enjoy saying hello and hearing your story. How we can help?

Call us: (443) 846 0511
Email us: info@avilahomecare.com
Visit us: 1122 Kenilworth Drive, Suite 307, Towson, MD, 21204
Hours of Operation: Monday – Friday 8:30 a.m. – 5 p.m.

**GBMC Joint & Spine Center**
6701 N. Charles Street, Unit 58: Suite 5835, Towson MD 21204
443-849-6261
April, Christine, & Casey
**Do not** take the following medications the day of your scheduled surgery.

### Angiotensin Converting Enzyme (ACE) Inhibitors
- Benazepril / amlodipine (Lotrel)
- Benazepril (Lotensin)
- Benazepril / HCTZ (Lotensin HCT)
- Captopril (Capoten®)
- Captopril / HCTZ (Capozide)
- Enalapril (Vasotec®)
- Enalapril / HCTZ (Vaseretic)
- Fosinopril (Monopril)
- Fosinopril / HCTZ (Monopril HCT)
- Lisinopril (Prinivil®, Zestril®)
- Lisinopril / HCTZ (Prinzide or Zestoretic)
- Moexipril (Univasc)
- Moexipril / HCTZ (Uniretic)
- Perindopril (Aceon)
- Quinapril (Accupril)

### Angiotensin Receptor Blockers (ARB)
- Azilsartan (Edarbi)
- Candesartan (Atacand)
- Candesartan/HCTZ (Atacand HCT)
- Eprosartan (Teveten)
- Eprosartan/HCTZ (Teveten HCT)
- Irbesartan (Avapro)
- Irbesartan / HCTZ (Avalide)
- Losartan (Cozaar®)
- Losartan / HCTZ (Hyzaar)
- Olmesartan (Benicar)
- Olmesartan / HCTZ (Benicar HCT)
- Telmisartan (Micardis)
- Telmisartan/HCTZ (Micardis HCT)
- Valsartan (Diovan)
- Valsartan / HCTZ (Diovan HCT)
- Azilsartan (Edarbi)

### Particulate Antacids
- Gaviscon
- Maalox
- Mylanta
- Milk of Magnesia
- Gaviscon

### Diuretics
**EXCEPTION: Do take for congestive heart failure or ascites, as directed by your doctor.**
- Acetazolamide (Diamox)
- Amiloride
- Amiloride/Hydrochlorothiazide (Moduretic)
- Bendroflumethiazide
- Bumetanide (Bumex)
- Chlorothiazide (Diuril)
- Chlorthalidone (Thalitone)
- Eplerenone (Inspra®)
- Ethacrylic acid (Edecrin)
- Furosemide (Lasix®)
- Hydrochlorothiazide (Microzide, Esidrix®)
- Indapamide (Lozol)
- Metolazone (Zaroxolyn)
- Methazolamide
- Metolazone (Zaroxoxlyn)
- Spironolactone (Aldactone)
- Spironolactone/Hydrochlorothiazide (Aldactazide)
- Torsemide (Demadex)
- Triamterene (Dyrenium)
- Triamterene / HCTZ (Dyazide, Maxzide)

### Appetite Suppressant (Diet Drug)
**Discontinue for 6 days pre-surgery**
- Phentermine (Adipex®, Suprenza®)
- Phentermine / Topiramate (Qsymia®)

### SGLT-2 Inhibitors
**Discontinue 4 days before surgery**
- Jardiance (empagliflozin)
- Invokana (canagliflozin)
- Farxiga (dapagliflozin)
- Steglatro (etugliflozin)

### Metformin ER
**Discontinue 24 hours before Surgery**
- Glucophage XR
- Glumetza
- Fortamet

**Metformin: Do not take on the morning of surgery**
Please ask your primary care team prior to taking the following medications the day of surgery.

### Anticoagulants:

**YOU MUST CONSULT WITH YOUR PRESCRIBING DOCTOR FOR DISCONTINUE DATE.**

- Dabigatran (Pradaxa®)
- Fondaparinux (Arixtra®)
- Apixaban (Eliquis®)
- Rivaroxaban (Xarelto®)
- Clopidogrel (Plavix®)
- Prasugrel (Effient®)
- Ticagrelor (Brilinta®)
- Ticlopidine (Ticlid®)
- Warfarin (Coumadin®)

### Aspirin or Salicylates:

**Discontinue for 10 days prior to your joint replacement or neurosurgery.** May cause excessive bleeding during surgery and recovery period. Again, please consult with your primary care team.

- Discontinue for 10 days prior to your joint replacement or neurosurgery. May cause excessive bleeding during surgery and recovery period.

**Vitamin E**
- **Fish Oil/Omega**
- **Glucosamine**
- CoQ10
- Gingko Biloba
- Ginseng
- Turmeric
- Garlic
- Dong quai
- Kava
- Ma-huang

### Anticoagulants:

**YOU MUST CONSULT WITH YOUR PRESCRIBING DOCTOR FOR DISCONTINUE DATE.**

- Dabigatran (Pradaxa®)
- Fondaparinux (Arixtra®)
- Apixaban (Eliquis®)
- Rivaroxaban (Xarelto®)
- Clopidogrel (Plavix®)
- Prasugrel (Effient®)
- Ticagrelor (Brilinta®)
- Ticlopidine (Ticlid®)
- Warfarin (Coumadin®)

### Aspirin or Salicylates:

**Discontinue for 10 days prior to your joint replacement or neurosurgery.** May cause excessive bleeding during surgery and recovery period.

- Discontinue for 10 days prior to your joint replacement or neurosurgery. May cause excessive bleeding during surgery and recovery period.

**Vitamin E**
- **Fish Oil/Omega**
- **Glucosamine**
- CoQ10
- Gingko Biloba
- Ginseng
- Turmeric
- Garlic
- Dong quai
- Kava
- Ma-huang

### Non-steroidal anti-inflammatory (NSAID)

- **Neurosurgery:** stop 10-days before surgery.
- **Joint replacement surgery:** stop 7-days before surgery

- Diclofenac ( Cataflam®, Voltaren®)
- Etodolac ( Lodine®)
- Fenoprofen ( Nalfon®)
- Flurbiprofen ( Ansaid®)
- Ibuprofen ( Advil®, Motrin®)
- Ibuprofen/Hydrocodone ( Vicoprofen®)
- Ibuprofen/Oxycodone ( Combunox®)
- Indomethacin ( Indocin®)
- Ketoprofen ( Orudis KT®, Oruvail®)
- Ketorolac ( Toradol®)
- Meclofenamate ( Meclomen®)
- Mefenamic Acid ( Ponstel®)
- Tolmetin ( Tolectin®)
- Diflunisal ( Dolobid®)
- Etodolac ( Lodine XL®)
- Meloxicam ( Mobic®)
- Nabumetone ( Relafen®)
- Naproxen ( Aleve®, Anaprox®, Naprosyn®)
- Oxaprozin ( Daypro®)
- Piroxicam ( Feldene®)
- Sulindac ( Clinoril®)
- Celecoxib ( Celebrex®) - Neurosurgery patients

- **Celecoxib (Celebrex)**
  - Joint Replacement patients ONLY:
  - Does not need to be discontinued.

### MAO inhibitors:

- Obtain psychiatry consult before elective surgery for further instructions. **Discontinue for 48 hours prior to your joint replacement or neurosurgery.**

- Isocarboxazid ( Marplan®)
- Phenelzine ( Nardil®)
- Tranylcypromine ( Parnate®)
- Rasagiline ( Azilect®)
- Selegiline patch ( Emsam®)
- Isocarboxazid ( Marplan®)
- Phenelzine ( Nardil®)
- Tranylcypromine ( Parnate®)
- Rasagiline ( Azilect®)
- Selegiline patch ( Emsam®)
You may take the following medications the day of your surgery.

**Beta Blockers**
- Acebutolol (Sectral)
- Atenolol (Tenormin)
- Betaxolol (Kerlone)
- Bisoprolol (Zebeta)
- Carvedilol (Coreg)
- Metoprolol (Lopressor, Toprol XL)
- Nadolol (Corgard)
- Nebivolol (Bystolic)
- Penbutolol (Levatol)
- Pindolol (Visken)
- Propranolol (Inderal)
- Sotalol (Betapace)

**Calcium Channel Blocker**
- Amlodipine (Norvasc®)
- Clevipidine (Cleviprex®)
- Diltiazem (Cardizem®)
- Felodipine (Plendil®)
- Isradipine (Dynacirc®)
- Nicardipine (Cardene®)
- Nifedipine (Procardia®, Adalat®)
- Nimodipine (Nimotop®)
- Verapamil (Calan®, Covera-HS®, Verelan®)

**Bronchodilators, Inhaled Steroids, Anticholinergics, or combination of these**
- Albuterol (ProAir, Proventil, Ventolin)
- Albuterol/Ipratropium (Duoneb, Combivent)
- Formoterol/Budesonide (Symbicort)
- Formoterol/Mometasone (Dulera)
- Ipratropium (Atrovent)
- Levalbuterol (Xopenex)
- Salmeterol (Serevent)
- Salmeterol/Fluticasone (Advair)
- Beclomethasone (QVAR)
- Flunisolide (AeroBid)
- Fluticasone (Flovent)
- Mometasone (Asmanex)
- Triamcinolone (Asmacort)
- Fluticasone/vilanterol (Breo)
- Tiotropium/olodaterol (Stiolto)

**Statins**
- Atorvastatin (Lipitor)
- Fluvastatin (Lescol)
- Lovastatin (Mevacor)
- Pitavastatin (Livalo)
- Pravastatin (Pravachol)
- Rosuvastatin (Crestor)
- Simvastatin (Zocor)

**Opioid/Narcotics**
- Fentanyl Patch (Duragesic)
- Hydromorphone SR (Exalgo)
- Methadone (Dolophine)
- Morphine SR (MS Contin, Kadian, Avinza)
- Morphine SR/Naltrexone (Embeda)
- Oxycodone SR (Oxycontin)
- Oxymorphone (Opana ER)
- Hydrocodone
- Hydrocodone/Acetaminophen (Hyct, Lorct, Lortab, Norco, Vicodin, Zydone)
- Hydrocodone/Ibuprofen (Vicoprofen)
- Hydromorphone (Dilaudid)
- Hydromorphone ER (Exalgo)
- Morphine
- Oxycodone (Roxicodone)
- Oxycodone/Acetaminophen (Percocet, Endocet, Roxicet)
- Oxycodone/Aspirin (Percodan, Endodan)
- Propoxyphene/Acetaminophen (Darvocet)
- Propoxyphene/Aspirin (Darvon)
- Tapentadol (Nucynta)

**Steroids (Glucocorticoids)**
- Prednisone
- Methylprednisolone (Medrol) or (Solumedrol)

**Opioid Agonist/Antagonist: Consider transitioning to alternative medication 1-2 weeks prior to elective surgery by the prescribing physician.**
- Buprenorphine/Naloxone (Suboxone)
- Buprenorphine patch (Butrans)
- Naltrexone (Viivetrol, ReVia, Depade)

**Thyroid hormone**
- Levothyroxine (Synthroid, Levoxyl)
- Dessicated thyroid (Armour Thyroid)

**Celecoxib (Celebrex) - NSAID**
- Celebrex: **Joint Replacement** patients ONLY
You may take the following medications the day of your surgery.

**GERD/antacids**
- Esomeprazole (Nexium)
- Lansoprazole (Prevacid)
- Omeprazole (Prilosec)
- Pantoprazole (Protonix)
- Rabeprazole (Aciphex)

**Skeletal Muscle Relaxants**
- Carisoprodol (Soma)
- Metaxalone (Skelaxin)

**Histamine H2 blockers**
- Cimetidine (Tagamet)
- Famotidine (Pepcid)
- Nizatidine (Axid)
- Ranitidine (Zantac)

**Alzheimer’s (acetyl cholinesterase inhibitors)**
- Donazepil (Aricept)
- Galantamine (Razadyne)
- Rivastigmine (Exlon)
- Tacrine (Cognex)

**Antidepressants (and anti-anxiety)**
- Citalopram (Celexa®)
- Duloxetine (Cymbalta)
- Escitalopram (Lexapro®)
- Fluoxetine (Prozac®)
- Fluvoxamine (Luvox®)
- Paroxetine (Paxil®)
- Sertraline (Zoloft®)
- Strattera (Atomoxetine®)
- Desvenlafaxine (Pristiq, Khedezla)
- Amitriptyline (Elavil®)
- Bupropion (Wellbutrin)
- Desipramine (Norpramin)
- Doxepin (Sinequan)
- Imipramine (Tofranil)
- Mirtazapine (Remeron®)
- Nefazodone (Serzone)
- Nortriptyline (Pamelor)
- Trazodone (Desyrel)
- Buspirone (Buspar)

**Psychiatric (including anxiety and depression) and Neurological Medications**
- Alprazolam (Xanax®)
- Chlordiazepoxide (Librium®)
- Diazepam (Valium®)
- Clonazepam (Klonopin)

**Anticonvulsants**
- Carbamazepine (Tegretol)
- Felbamate (Felbatol)
- Gabapentin (Neurontin)
- Levetiracetam (Keppra)
- Lamotrigine (Lamictal)
- Oxcarbazepine (Trileptal)
- Phenytoin (Dilantin)
- Pregabalin (Lyrica)
- Primidone (Mysoline)
- Tiagabine (Gabitril)
- Topiramate (Topamax)
- Valproic Acid (Depakote)
- Zonisamide (Zonegran)

**ADHD (stimulant and non-stimulant)**
- Dextroamphetamine (Adderall)
- Lisdexamfetamine (Vyvanse)
- Dexmethylphenidate (Focalin)
- Methylphenidate (Ritalin, Metadate, Concerta, Daytrana patch)
- Guanfacine (Intuniv)
- Atomoxetine (Strattera)

**Lithium**
You may take morning of surgery. Please consult with your psychiatrist for instructions.
Discharge Day Checklist Guide- Joint

☐ _____ I have reviewed my discharge instructions with the nurse

☐ _____ I know who is my support person/help at home

☐ Post-op Physical Therapy/Occupational Therapy Agency: ________________
   ➢ Phone #___________________ Start of Care Date:____________________
   ➢ If I haven’t heard from the Physical Therapy Agency 3-days after discharge or have any issues with scheduling, I will call my surgeon’s office as soon as possible

☐ _____ Do I have my prescription(s)?
   ➢ Medication(s) MUST be picked up the day of discharge
   ➢ GBMC Walgreens can deliver your medications to your room, accepts cash or credit cards

☐ _____ Do I know the reason for and side effects of my prescriptions?

☐ I have my…
   ➢ _____ Walker and/or cane (if you do not have one, insurance approval is needed)
   ➢ _____ Ice packs (2 for hips and 4 for knees) and the wrap
   ➢ _____ Dressing material (gauze and tape)
   ➢ _____ Nozin® Nasal Sanitizer® 12-mL bottle and starter cotton swabs
   ➢ _____ Belongings that I brought into the hospital

☐ If you are a high-risk for developing blood clots your surgeon may recommend a portable SCD device for you to take home

☐ I will call my surgeon’s office with any signs of infection such as fever, redness, swelling, tenderness, or puss-like drainage

☐ Please contact your surgeon’s office with any questions at (_______________)
Orthopaedic Care that You Would Want for Your Loved Ones

GBMC recently earned The Joint Commission’s Gold Seal of Approval® for Advanced Certification for Total Hip and Total Knee Replacement.

We are only the third hospital in Maryland to earn this distinction. The advanced certification is for Joint Commission-accredited hospitals and ambulatory surgery centers seeking to elevate the quality of their care.

We underwent a rigorous onsite review in late January 2019, when Joint Commission experts evaluated compliance with advanced disease-specific care standards and total hip and total knee replacement requirements, including orthopaedic consultation, and pre-operative, intraoperative, and post-surgical orthopaedic surgeon follow-up care.

Valid for 24 months, this advanced certification is evidence of the high standards of GBMC and our commitment to continually improve. Led by Leroy Schmidt, MD, our fabulous team of orthopaedists, advanced practitioners, nurses, physical therapists, occupational therapists, primary care providers, and other clinicians has generated outstanding outcomes with an excellent care experience.

In the past, joint replacement surgery meant a possible hospital stay of 1 to 2 weeks with significant post-operative pain, a significant risk of infection, and a lengthy recovery. Advances in joint replacement surgery have substantially reduced post-operative pain and complication rates, enabling us to discharge most patients after an overnight stay. I am happy to report that the risk of infection has been significantly reduced. In the past six months (September 2018-February 2019), we had 117 hip surgeries with 0 infections and 222 knee surgeries with 0 infections.

Our Enhanced Recovery After Surgery program (ERAS) allows for outpatient joint replacement surgery in selected cases. And, now we’ve started the Episode of Care Improvement Program (ECIP) to further improve the care experience and reduce waste. This innovative approach allows us to better prepare the patient for surgery and to eliminate the need for inpatient rehabilitation. Members of the care team educate joint replacement candidates about medical conditions that can negatively affect the outcome of their surgery and how to better manage these pre-existing conditions. In addition, the patient's functional mobility and support system is assessed to assure that they can receive their physical therapy in their dwelling rather than in a skilled nursing facility.

In addition to Dr. Schmidt, I want to thank all the members of our Joint & Spine Program for helping us attain this major achievement, especially April Asuncion Higgins, RN, BSN, CMSRN, Joint & Spine Program Coordinator, and Joy Reynolds, RN, Nurse Manager U58, and Joint & Spine Program.

“To every patient, every time, we will provide the care that we would want for our own loved ones.”

MISSION

The mission of GBMC is to provide medical care and service of the highest quality to each patient and to educate the next generation of clinicians, leading to health, healing and hope for the community.

VISION

As our national healthcare system evolves, for GBMC to maintain its status as a provider of the highest quality medical care to our community, we must transform our philosophy and organizational structure, to develop a model system for delivering patient-centered care.

We define patient-centered care as care that manages the patient’s health effectively and efficiently while respecting the perspective and experience of the patient and the patient’s family. Continuity of care and ease of navigation through a full array of services is highly important to us. Our professional staff can say with confidence that the guidance and medical care they are providing mirrors what they would want for their own family.

We will create the organizational and economic infrastructure required to deliver evidence-based, patient-centered care and for holding ourselves accountable for that care. This will be defined by collaboration and improvement. Physicians lead teams that will manage patient care.

We are moving into the future with renewed energy and increasing insight. We look forward to building relationships with both community-based and employed physicians that will form the foundation of Greater Baltimore Health Alliance. We welcome all those who share our vision of healthcare as it is transformed to meet the needs of our community.

VALUES

GBMC has formalized a series of specific behaviors that support its Greater Values of Respect, Excellence, Accountability, Teamwork, Ethical Behavior and Results. The Greater Values are intended to serve as the foundation upon which GBMC creates and sustains a culture of Service Excellence.

Respect: I will treat everyone with courtesy.
I will foster a healing environment.

Excellence: I will strive for superior performance in every aspect of my work. I will recognize and celebrate the accomplishments of others.

Accountability: I will be professional in the way I act, look and speak. I will take ownership to solve problems.

Teamwork: I will be engaged and collaborative.
I will keep people informed.

Ethical Behavior: I will always act with honesty and integrity. I will protect the patient.

Results: I will set goals and measure outcomes that support organizational goals. I will give and accept help to achieve goals.

ACCREDITATION

Greater Baltimore Medical Center (GBMC), is a non-profit healthcare organization, licensed and accredited by the Joint Commission on Accreditation for Health Care Organizations (JCAHO). All GBMC primary care practices are NCQA Certified Medical Care Homes and Gilchrist is CHAP accredited.
