comprehensive oral rehabilitation

• Surgical preparation:
  1) Reduces secondary surgical procedures
  2) Facilitates prosthetic rehabilitation
  3) Efficient and improved clinical outcome

• Fewer appointments, reduced adjustments, reduced prostheses revisions to accommodate tissue healing changes.

• This shortens the rehabilitation period and cuts down the financial burden on the patient.

reconstructive surgeons:
Concern with dental complications secondary to surgery
Growing need for greater understanding of our collaborative disciplines
comprehensive oral rehabilitation

**PROSTHODONTIC CHALLENGE**

- Patients with compromising dental complications
  1) Send the patient back to the surgeon for "corrective" procedures
  2) Struggle to achieve a functionally compromised result

- Patient's health or fear of additional surgery denies the option of a corrective surgical procedure.

- Prosthetic pre-surgical planning to attain maximal rehabilitative results.

- Complete, effective communication and cooperation between the surgeon and the prosthodontist.
comprehensive oral rehabilitation

IDEAL SITUATION
• Development of a team approach
• The surgeon and prosthodontist plan together
• Prior to surgery

What will best prepare for prosthodontic rehabilitation
