American Institute for Cancer Research gives the following recommendations for cancer prevention:

1. Be as lean as possible without becoming underweight.
2. Be physically active for at least 30 minutes every day.
3. Avoid sugary drinks. Limit consumption of energy-dense foods (particularly processed foods high in added sugar or low in fiber, or high in fat).
4. Eat more of a variety of vegetables, fruits, whole grain and legumes such as beans.
5. Limit consumption of red meats (such as beef, pork and lamb) and avoid processed meats.
6. If consumed at all, limit alcoholic drinks to two for men and one for women a day.
7. Limit consumption of salty foods and foods processed with salt (sodium).
8. Don’t use supplements to protect against cancer.

Special Population Recommendations:
• It is best for mothers to breastfeed exclusively for up to six months and then add other liquids and foods.
• After treatment, cancer survivors should follow the recommendations for cancer prevention.

And always remember – do not smoke or chew tobacco.

**Nutrition Goals during Treatment**

**Goal 1:** Consume adequate calories to maintain body weight.

**Goal 2:** Choose high protein foods such as eggs, beef, chicken, fish, cheese, beans and nuts.

**Goal 3:** Add snacks in between meals if needed to increase calorie intake.

**Goal 4:** Choose commercial liquid supplements as a meal replacement or snack.

**Goal 5:** Meet daily fluid needs – about 60-70 ounces each day.

**Cancer Survivorship Recommendations**

Through scientific research, we know of the many associations of nutrition and cancer. Recommendations for cancer prevention are the same as those to prevent other chronic diseases. Therefore, healthy eating is important not only for cancer prevention but also to prevent obesity, hypertension, heart disease and diabetes.

**Antioxidants**

People who consume a diet high in antioxidants may have a reduced risk of developing cancer. Antioxidants come from many sources such as:

- Fruits
- Vegetables
- Whole grains
- Beans and legumes
- Nuts

It is recommended to consume five or more servings of fruits and vegetables daily, make half your grains whole and have one ounce of nuts each day.

**Omega-3 Fats**

Omega-3 fats are “healthy” fats. Research has shown that diets high in omega-3 fats are beneficial in the protection of cancer.

*Some examples are:*

- Salmon, herring, mackerel
- Walnuts
- Flax seed – ground or oil
- Canola Oil

It is recommended to eat two servings of fish weekly, one ounce of walnuts or one tablespoon of ground flax seed each day.

**Fiber**

Foods high in fiber have been associated with reduced cancer risk. Some ways to get fiber is with products that contain:

- Fruits and vegetables
- Whole wheat
- Oats
- Bran
- Beans and legumes

Every person needs about 25 grams of fiber every day.

**Vitamin Supplementation**

There is no scientific evidence that vitamin supplements prevent or cure cancer. They are beneficial as an addition to a healthy diet however, during cancer treatment, it is recommended that patients refrain from taking vitamin or herbal supplements. Most products have not been tested with cancer treatments to determine benefit or harm.
